ABSTRACT

The simultaneous occurrence of fractures in both the scaphoid and distal radius presents a unique challenge in orthopedic emergency medicine. This abstract provides an overview of the clinical significance, diagnostic approaches, and treatment considerations for this uncommon but complex injury pattern.

1. Discussion

Fractures occurring simultaneously in both ipsilateral scaphoid and distal radius are infrequent. The limited number of documented cases discussing this dual injury pattern showcase diverse characteristics among patients, mechanisms causing the injuries, and approaches to treatment.¹

Detecting a concomitant scaphoid bone fracture through radiographic means is usually a challenging task, often susceptible to oversight. Identifying this concurrent fracture holds significance to ensure proper immobilization. Insufficient treatment arising from an unnoticed scaphoid fracture could lead to persistent wrist pain and potentially even Sudeck's atrophy.²

The association of a scaphoid and distal radius fracture introduces a dilemma in the application of fixation principles. Generally, scaphoid fractures need compression for fixation, whereas achieving reduction in distal radius fractures often calls for distraction. Both our team and other researchers are of the opinion that the customary treatment approach involves internally fixing the scaphoid and utilizing volar plating for the distal radius.³

2. Visual case discussion

A 36-year-old female construction worker, presented to the emergency department with complaints of severe pain and swelling in her right wrist. She reported a history of slipping and falling on an outstretched hand while working at a construction site earlier that day. The patient was unable to use her right hand due to the pain and swelling. There was no loss of consciousness or other associated injuries reported.

The patient had no significant past medical history and no history of previous fractures or joint issues.

Upon presentation, she appeared to be in significant discomfort, the right wrist was visibly swollen and tender to the touch. Range of motion at the wrist joint was limited due to pain. There was no obvious deformity or open wounds. Neurovascular examination of the hand was within normal limits.

X-ray imaging of the right wrist revealed a displaced fracture of the distal radius was observed, involving the distal metaphysis (right arrows), with ipsilateral complex fracture of the scaphoid (oblique arrows). According to Herbert's classification (Fig. 1).

The patient was taken to the operating room for open reduction and internal fixation. The procedure involved using a volar distal radius plate via the Henry approach for the distal radius fracture (right arrows), and retrograde screw fixation of the scaphoid using a Herbert screw (oblique arrows). The treatment was finalized with casting for a period of 6 weeks (Fig. 2).

Rehabilitation initiation encompassed isometric exercises, finger mobilization, and pain mitigation, this protocol persisted even after the cast was removed.

At the six-month follow-up, the patient exhibited seamless and painless range of motion (Fig. 3). She returned her usual daily routines without encountering any constraints.
