conservation and sustainability goals Nonetheless the extent to which all these initiatives can provide lasting positive effects on conservation and restoration targets is often impaired limited by the lack of robust baseline data and systematic monitoring which in turn are constrained by the limited number of long term monitoring programs and limited dedicated funding This collection underlines the importance of monitoring in times of global change and shifting baselines and the urgency of boosting conservation strategies to ensure progression towards meeting global conservation objectives Emphasis is given also to the socio ecological contexts and dimensions of conservation efforts and the potential of societal engagement in monitoring practices a key enabling factor to turn conservation initiatives into practical actions and ecosystem protection

Joint FAO-IOC-IAEA technical guidance for the implementation of early warning systems for harmful algal blooms Food and Agriculture Organization of the United Nations, United Nations Educational, Scientific and Cultural Organization-IOC, International Atomic Energy Agency, 2023-03-16 Globally there are 3 400 to 4 000 described species of marine microalgae but only 1 to 2 percent are considered to be harmful Harmful algal blooms HABs have significant impacts on food safety and security through contamination or mass mortalities of aquatic organisms The impacts and mass mortalities of marine species caused by harmful algae are not new and have been recorded for decades However there is growing concern that these events will increase due to accelerating global warming climate change and anthropogenic activities Indeed if not properly controlled aquatic products contaminated with HAB biotoxins are responsible for potentially deadly foodborne diseases and when rapidly growing HAB consequences include reduced dissolved oxygen in the ocean dead zones and mass mortalities of aquatic organisms Improving HAB forecasting is an opportunity to develop early warning systems for HAB events such as food contamination mass mortalities or foodborne diseases Surveillance systems have been developed to monitor HABs in many countries however the lead time or the type of data i e identification at the species level determination of toxicity may not be sufficient to take effective action for food safety management measures or other reasons such as transfer of aquaculture products to other areas Having early warning systems could help mitigate the impact of HABs and reduce the occurrence of HAB events The Joint FAO IOC IAEA technical guidance for the implementation of early warning systems EWS for HABs will guide competent authorities and relevant institutions involved in consumer protection or environmental monitoring to implement early warning systems for HABs present in their areas marine and brackish waters specifically those affecting food safety or food security benthic HABs fish killing HABs pelagic toxic HABs and cyanobacteria HABs The guidance provides a roadmap for stakeholders on how to improve or implement an EWS for HABs and biotoxins where appropriate It is important to note that not all countries and institutions can implement the same level of EWS for HABs and this guidance is intended mainly for those who seek to broaden existing early warning systems or who are just beginning to consider putting a system in place
