Physical Activity, Self-Regulation, and Executive Control Across the Lifespan Sean P. Mullen, Peter Hall, 2016-02-05 There is overwhelming evidence linking increased physical activity with positive changes in cognitive functioning and brain health Much of what we know about these interrelationships comes from aerobic exercise training studies with older adults and children This literature has paved the way for the neuroscientific investigation of mechanisms responsible for exercise induced cognitive and brain health enhancement a list that ranges from molecular changes to systemic changes in executive control and neural connectivity A new perspective has also emerged that aims to understand executive control processes that may underlie the regulation of health behavior In accordance with this view physical activity falls under the umbrella of health behaviors that require a substantial amount of executive control Executive control is a limited resource and the aging process depletes this resource People who regularly exercise are said to have higher self regulatory control planning goal shielding and impulse control than irregular exercisers The successful maintenance of physical activity participation in lieu of daily cognitive stressors likely reflects an adaptive resistance to control failures Indeed a handful of studies have shown the relationship between greater executive control and subsequently higher levels of physical activity However little is known about the neural correlates of physical activity adherence or sedentary behavior with the view that neurocognitive factors have an antecedent and reciprocal influence on these behaviors No research has focused on the brain networks responsible for the self regulation of physical activity which likely overlaps with structures and functions playing critical roles in the regulation of other health behaviors Interdisciplinary investigations are needed to explain the extent to which physical activity self regulation and self regulatory failure is dependent upon or under the influence of executive control processes and brain networks Understanding the degree to which self regulatory resources may be enhanced restored and trained will have enormous implications for basic science and applied fields It is also of great import to understand whether or not physical activity self regulation is a domain specific behavior associated with specific brain networks or to determine the extent to which regulatory network sharing occurs The aim of this Frontiers Research Topic is to curate contributions from researchers in social and cognitive neurosciences and related fields whose work involves the study of physical activity behavior self regulation and executive control For this Research Topic we therefore solicit reviews original research articles

and opinion papers which draw theoretical or empirical connections related to sustained physical activity behavior self regulatory strategies cognitive performance and brain structure and function While focusing on work in the neurosciences this Research Topic also welcomes contributions in the form of behavioral studies psychophysiological investigations and methodological innovations This Frontiers Research Topic will carve out new directions for the fields of exercise cognitive and social neurosciences We hope you will consider submitting your work

Mauger,Florentina J. Hettinga,Dominic P. Micklewright,Andrew Renfree,Benjamin Pageaux,Hollie S. Jones,Jo

Corbett,2017-11-22 Successful endurance performance requires the integration of multiple physiological and psychological systems working together to regulate exercise intensity in a way that will reduce time taken or increase work done The systems that ultimately limit performance of the task are hotly contested and may depend on a variety of factors including the type of task the environment external influences training status of the individual and a host of psychological constructs These factors can be studied in isolation or inclusively as a whole body or integrative system A reductionist approach has traditionally been favoured leading to a greater understanding and emphasis on muscle and cardiovascular physiology but the role of the brain and how this integrates multiple systems is gaining momentum However these differing approaches may have led to false dichotomy and now with better understanding of both fields there is a need to bring these perspectives together The divergent viewpoints of the limitations to human performance may have partly arisen because of the different exercise models studied These can broadly be defined as open loop where a fixed intensity is maintained until task disengagement or closed loop where a fixed distance is completed in the fastest time which may involve whole body or single limb exercise Closed loop exercise allows an analysis of how exercise intensity is self regulated i e pacing and thus may better reflect the demands of competitive endurance performance However whilst this model can monitor changes in pacing this is often at the expense of detecting subtle differences in the measured physiological or psychological variables of interest Open loop exercise solves this issue but is limited by its more restrictive exercise model Nonetheless much can be learnt from both experimental approaches when these constraints are recognised Indeed both models appear equally effective in examining changes in performance and so the researcher should select the exercise model which can most appropriately test the study hypothesis Given that a multitude of both internal e g muscle fatigue perception of effort dietary intervention pain etc and external e g opponents crowd presence course topography extrinsic reward etc factors likely contribute to exercise regulation and endurance performance it may be that both models are required to gain a comprehensive understanding Consequently this research topic seeks to bring together papers on endurance performance from a variety of paradigms and exercise models with the overarching aim of comparing examining and integrating their findings to better understand how

exercise is regulated and how this may or may not limit performance

Die Fridericiana Alexandrina Navis (F.A.N.) Boris Dreyer, 2022-05-18 2016 fiel die Entscheidung für den Nachbau eines Römmerbootes aus Anlass 275 Jubiläums der Universität Erlangen Nürnberg nach einem Originalfund von Oberstimm. Der historische Grad der Rekonstruktion ist bislang unerreicht einschließlich der Teile des Bootes, die am Wrack nicht erhalten geblieben waren. In Kooperation mit Instituten der Universität mit Fachleuten zum antiken Bootsbau und zur traditionellen Schifffahrt entstand die Fridericiana Alexandrina Navis F.A.N., an der zum ersten Mal auch die enkaustische Bemalung getestet wurde. Mehr Alternativen denn je wurden gefertigt, damit die Tests an Riemen, Ruder und mit Segeln die optimale Ausrichtung eines solchen Bootes und damit die Leistungspotentiale des Bootstyps aufzeigen können. Viele Erkenntnisse warten auf den Leser und auch ein echtes Erlebnis, wovon die Berichte der Mitbauenden und Mitfahrenden zeugen. Ein Erfolg auf ganzer Linie, das vermittelt das Buch mit den Schwerpunkten zu Bau, Fahrt und Wissensvermittlung.

Origin of Cosmic Rays G. Setti, G. Spada, A.W. Wolfendale, 2012-12-06 The cosmic radiation was discovered by Hess in 1912 but its origin is still the subject of much controversy and considerable study. For several decades most workers in the cosmic ray field were interested in the Nuclear Physical aspect of the particle beam and many important discoveries were made, notably the identification of the positron, the muon, the pion and the strange particles. More recently, however, emphasis has changed to the Astrophysical aspect, both with regard to the origin of the radiation and to its relation with the other radiation fields. Mindful of the increasing importance of the Astrophysical facets of the subject, the Cosmic Ray Commission of IUPAP approached the High Energy Astrophysics Commission of the IAU with the suggestion of a joint Symposium on Cosmic Ray Origin. The plan was to

bring together workers in all the various astronomical fields from Radio through Optical to Gamma Rays with Cosmic Ray physicists and to fully explore the various interrelations The approach was received with enthusiasm and this book contains the proceedings of the ensuing Symposium styled IUPAP IAU Symposium No 94 which was held in Bologna from 11th 14th June 1980 Virtually all the papers presented are reproduced here The Scientific Organizing Committee chose the invited speakers whose papers formed the major scientific component of the meeting Additional short contributed papers were also called for and very brief 2 page resumes which have not been refereed are given in the proceedings **Practical**
