

CHAPTER 2

Cellular respiration: involves the oxidation of organic molecules (usually carbohydrates and lipids) to produce energy (ATP) and release carbon dioxide and water.

ATP: Adenosine Triphosphate (ATP) is the primary energy currency of the cell. It is a nucleotide derivative composed of adenine, ribose, and a triphosphate group. The energy is stored in the high-energy phosphate bonds between the phosphate groups.

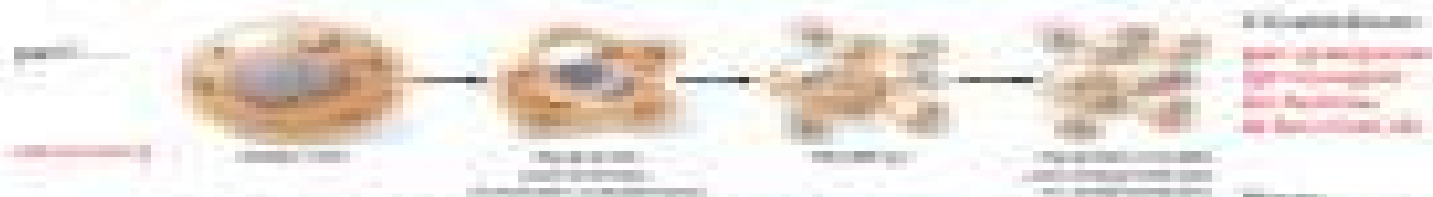

Energy flow: Energy flows from the sun to producers (plants) through photosynthesis. Producers then transfer energy to consumers (animals) through feeding. Energy is lost as heat at each step of the process.

Metabolic pathways: Metabolic pathways are the series of chemical reactions that occur in the cell to convert nutrients into energy. Key pathways include glycolysis, the citric acid cycle, and oxidative phosphorylation.

Photosynthesis: The process by which plants and other autotrophs convert light energy into chemical energy (glucose) using carbon dioxide and water.

CHAPTER 2

Photosynthesis: The process by which plants and other autotrophs convert light energy into chemical energy (glucose) using carbon dioxide and water.

Chloroplast: The organelle in plant cells where photosynthesis occurs. It contains chlorophyll and other pigments that absorb light energy. The process takes place in the stroma and thylakoid membranes.

Light energy: The energy from the sun that is captured by chlorophyll and used to drive the photosynthesis process.

Photosynthesis and energy: The process of photosynthesis converts light energy into chemical energy stored in glucose. This energy is then used by the cell for various metabolic processes. The overall equation for photosynthesis is: $6\text{CO}_2 + 6\text{H}_2\text{O} \xrightarrow{\text{Light}} \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
