An Integrated Formal Task Specification Method for Smart Environments Maik Wurdel,2011 This thesis is concerned with the development of interactive systems for smart environments One of the characteristic of smart environments is the need to support different interaction paradigms at runtime On the one hand interaction is performed explicitly the user performs an action in order to interact with the system e g pressing a button to adjust the light On the other hand actions of the user are interpreted by the smart environment even though they have not been performed primarily to interact with the system implicit interactions e g walking to the speaker s desk to give a talk A smart environment tries to infer those interactions to assist the user in her work e g display slides at the projection canvas Both interaction paradigms originate from different research fields and are currently treated independently although implicit and explicit interaction mutually influence each other and occur interleaved The thesis introduces a task modeling language in order to cope with the given requirements of smart environments which can be used to perform interaction development for smart environments in a model based fashion for both interaction paradigms

Applications of Computational Learning and IoT in Smart Road Transportation System Saurav Mallik, Hong Qin, Subrata Nandi, Munshi Yusuf Alam, Arup Roy, Tanvir Habib Sardar, 2025-05-08 This book discusses machine learning and AI in real time image processing for road transportation and traffic management There is a growing need for affordable solutions that make use of cutting edge technology like artificial intelligence AI machine learning ML and the Internet of Things IoT The efficiency sustainability and safety of transport networks can be greatly increased by implementing an Internet of Things IoT and machine learning ML based smart road transport system Install sensors on roadways and intersections to gather data on traffic conditions in real time such as vehicle density speed and flow Predicting traffic patterns is done by analyzing the gathered data using machine learning algorithms This can lessen traffic enhance overall traffic management and optimize traffic signal timings Vehicles equipped with Internet of Things devices can have their health monitored in real time

Parameters including lane changes brake condition tire pressure and engine performance can all be monitored by sensors Based on the gathered data ML models are used to forecast probable maintenance problems By scheduling preventive maintenance failures can be avoided and overall road safety can be increased Create a smartphone app that would enable drivers to locate parking spots in their area To forecast parking availability based on past data the time of day and special events apply machine learning algorithms Integrate Internet of Things IoT sensors into fleet vehicles to monitor their performance location and fuel consumption To maximize fleet efficiency reduce fuel consumption and plan routes more effectively apply machine learning algorithms Train ML models to forecast the quickest and most efficient routes with the help of historical data analysis Route recommendations for drivers or fleet management systems can be constantly adjusted with real time updates which contain real time data on road conditions accidents and construction To guarantee smooth integration and efficient implementation government organizations transportation providers and technology firms must work together
