Kokhanovsky, 2010-08-05 Light scattering by densely packed inhomogeneous media is a particularly challenging optics problem In most cases only approximate methods are used for the calculations However in the case where only a small number of macroscopic scattering particles are in contact clusters or aggregates it is possible to obtain exact results solving Maxwell's equations Simulations are possible however only for a relatively small number of particles especially if their sizes are larger than the wavelength of incident light The first review chapter in Part I of this volume prepared by Yasuhiko Okada presents modern numerical techniques used for the simulation of optical characteristics of densely packed groups of spherical particles In this case Mie theory cannot provide accurate results because particles are located in the near field of each other and strongly interact As a matter of fact Maxwell's equations must be solved not for each particle separately but for the ensemble as a whole in this case The author describes techniques for the generation of shapes of aggregates The orientation averaging is performed by a numerical integration with respect to Euler angles The numerical aspects of various techniques such as the T matrix method discrete dipole approximation the finite difference time domain

method effective medium theory and generalized multi particle Mie so tion are presented Recent advances in numerical techniques such as the grouping and adding method and also numerical orientation averaging using a Monte Carlo method are discussed in great depth

Environmental Modeling Mike J. Barnsley, 2007-02-13 Increasingly used to represent climatic biogeochemical and ecological systems computer modeling has become an important tool that should be in every environmental professional s toolbox Environmental Modeling A Practical Introduction is just what it purports to be a practical introduction to the various methods techniques and skills required for computerized environmental modeling Exploring the broad arena of environmental modeling the book demonstrates how to represent an environmental problem in conceptual terms formalize the conceptual model using mathematical expressions convert the mathematical model into a program that can be run on a desktop or laptop computer and examine the results produced by the computational model Equally important the book imparts skills that allow you to develop implement and experiment with a range of computerized environmental models The emphasis is on active engagement in the modeling process rather than on passive learning about a suite of well established models The author takes a practical approach throughout one that does not get bogged down in the details of the underlying mathematics and that encourages learning through hands on experimentation He provides a set of software tools and data sets that you can use to work through the various examples and exercises presented in each chapter as well as presentational material and handouts for course tutors Comprehensive and up to date the book discusses how computational models can be used to represent environmental systems and illustrates how such models improve understanding of the ways in which environmental systems function
