Spaceflight Dynamics William E. Wiesel, 1989-01-01 *Atmospheric and Space Flight Dynamics* Ashish Tewari, 2007-05-08 This book offers a unified presentation that does not discriminate between atmospheric and space flight. It demonstrates that the two disciplines have evolved from the same set of physical principles and introduces a broad range of critical concepts in an accessible yet mathematically rigorous presentation. The book presents many MATLAB and Simulink based numerical examples and real world simulations. Replete with illustrations, end of chapter exercises and selected solutions, the work is primarily useful as a textbook for advanced undergraduate and beginning graduate level students.

As a crew member of the STS 55 Space Shuttle mission and a full professor of astronautics at the Technical University of Munich, Ulrich Walter is an acknowledged expert in the field. This book is based on his extensive teaching and work with students, and the text is backed up by numerous examples drawn from his own experience. With its end of chapter examples and problems, this book is suitable for graduate level or even undergraduate courses in spaceflight as well as for professionals working in the space industry. This fourth edition includes substantial revisions of many sections to extend their coverage. These include an overview of the different approaches to solving Newton's gravitational equation of motion, a concise and newly structured coverage of orbital maneuvering, an enlarged and improved section about the sphere of influence, a new section about hierarchical three body systems, major enlargements in space reference frames and orbit geometry, and a new section about the earth reference ellipsoid. *Computational Modelling and Simulation of Aircraft and the Environment, Volume 1*

Dominic J. Diston, 2009-04-20 This first volume of *Computational Modelling of Aircraft and the Environment* provides a comprehensive guide to the derivation of computational models from basic physical/mathematical principles, giving the reader sufficient information to be able to represent the basic architecture of the synthetic environment. Highly relevant to practitioners, it takes into account the multi-disciplinary nature of the aerospace environment and the integrated nature of the models needed to represent it. Coupled with the forthcoming Volume 2 *Aircraft Models and Flight Dynamics*, it represents a complete reference to the modelling and simulation of aircraft and the environment. All major principles with this book are demonstrated using MATLAB, and the detailed mathematics is developed progressively and fully within the context of each individual topic area, thereby rendering the comprehensive body of material digestible as an introductory level text. The
