ABSTRACT Over the past decade advancements in areas of semiconductor device physics IC manufacturing and integration technologies on silicon have considerably increased the operating frequencies f subscript t of transistors in the deep sub micron regime This enabled design engineers to design circuits that operate at high frequencies and use high speed clock signals both leading to increased signal integrity problems for test engineers responsible for testing and validating integrated circuits While the design community is able to push the design envelope far into the future production IC test equipment has not kept pace with test requirements of high speed integrated wireless and wired communications designs This explosive improvement of design performance has made testing of high speed analog mixed signal circuits very challenging particularly under the constraints of high quality and low price In order to perform effective signal analysis and tests on such high frequency on chip signals one should be able to export those signals off chip However exporting high frequency on chip signals off chip without degrading the signal quality of the signals is not easy
