Osteosyntheses Reiner Labitzke,2000 In bone surgery it is essential to compress fractures interfragmentarily in order to make them resistant to the tensile force of muscles and the force resulting from acceleration and deceleration This can be best achieved by the use of cable tension bands as a traction mechanism The cable tension band is in terms of stability of fractures far superior to the conventional rigid cerclage wire which has been widely used in osteosynthesis for over 100 years

The author explains the biomechanics of the tension band in detail Theoretical findings are confirmed by clinical test results

All osteosynthetic techniques which can be carried out with cables are described giving details of operation instructions
