

Below is a schematic of a typical scooter electrical set up as far as the stator, CDI, rectifier/regulator go along with the other items running on the electrical system;

SPARK PATH

- 1: Stator sends energy via the red/black wire to the CDI to be stored
- 2: Magnet in flywheel causes coil in sensor to send impulse along trigger wire causing CDI to release energy to the coil
- 3: Coil steps up the voltage and sends it to the spark plug causing an arc across the electrode
- 4: The killswitch grounds the coil stopping the spark
- 5: The ignition switch uses the killswitch wire on many units to stop the engine, therefore if the killswitch wire is removed, the bike can be kickstarted and the engine will run because it generates its own spark even with the ignition switch off.

This is the 6 coil stator common on most 50cc scooter but also can be found on a 150cc too. The wire colors listed are very common but may vary. Stators come in different sizes ranging from the 6 coil mentioned above to the 18 coil versions on most 250cc scooters.
