Plants Roots - Buttress Roots
Plants absorb water and minerals from the soil through their roots. The roots of some plants, like the fig tree, are very large and spread out over a wide area. These roots are called buttress roots. They provide extra support for the tree and help it absorb more water and minerals.

Oxford Textbook of Cancer Biology Francesco Pezzella, Mahvash Tavassoli, David J. Kerr, 2019-05-06 The study of the biology of tumours has grown to become markedly interdisciplinary involving chemists statisticians epidemiologists mathematicians bioinformaticians and computer scientists alongside biologists geneticists and clinicians The Oxford Textbook of Cancer Biology brings together the most up to date developments from different branches of research into one coherent volume providing a comprehensive and current account of this rapidly evolving field Structured in eight sections the book starts with a review of the development and biology of multi cellular organisms how they maintain a healthy homeostasis in an individual and a description of the molecular basis of cancer development The book then illustrates as once cells become neoplastic their signalling network is altered and pathological behaviour follows It explores the changes that cancer cells can induce in nearby normal tissue the new relationship established between them and the stroma and the interaction between the immune system and tumour growth The authors

illustrate the contribution provided by high throughput techniques to map cancer at different levels from genomic sequencing to cellular metabolic functions and how information technology with its vast amounts of data is integrated with traditional cell biology to provide a global view of the disease The effect of the different types of treatments on the biology of the neoplastic cells are explored to understand on the one side why some treatments succeed and on the other how they can affect the biology of resistant and recurrent disease The book concludes by summarizing what we know to date about cancer and in what direction our understanding of cancer is moving Edited by leading authorities in the field with an international team of contributors this book is an essential resource for scholars and professionals working in the wide variety of sub disciplines that make up today s cancer research and treatment community It is written not only for consultation but also for easy cover to cover reading

Systems Biology Michael G. Katze, 2013-01-04 First systems biology is an inter disciplinary approach requiring the combined talents of biologists mathematicians and computer scientists Second systems biology is holistic with the goal of obtaining a comprehensive understanding of the workings of biological systems This is achieved through the acquisition of massive amounts of data by high throughput technologies oligonucleotide microarrays mass spectrometry and next generation sequencing and the analysis of this data through sophisticated mathematical algorithms It is perhaps the use of mathematics to integrate abundant and diverse types of data and to generate models of interconnected molecular networks that best characterizes systems biology

Biology and Management of Weeds and Invasive Plant Species under Changing Climatic and Management Regimes Ali Ahsan Bajwa,Mithila Jugulam,Maor Matzrafi,2021-11-03 **Genome Biology and Pyrethroid Resistance Mechanism of Anopheles Sinensis** Bin Chen,2024-07-18 This book includes 25 chapters which are rewritten from 25 most representative publications and aims to partially summarize our work and motivate further research in this field All of these achievements stem from joint efforts of all members in our laboratory including teachers and postgraduates participating in this field of research We are especially grateful to these teachers for their contributions Prof Dr Zheng Bo He Prof Dr Liang Qiao Prof Dr Yu Juan Zhang Prof Dr Ting Jing Li Dr Feng Ling Si Dr Zhen Tian Yan Dr Wen Bo Fu Dr Yong Zhou Dr Qi Yi He Dr Shu Lin He Dr Shuang Ren Dr Yi Yun Wei Dr Cao Zhou **Systems Biology of Transcription Regulation** Ekaterina Shelest,Edgar Wingender,Joerg Linde,2016-09-09 Transcription regulation is a complex process that can be considered and investigated from different perspectives Traditionally and due to technical reasons including the evolution of our understanding of the underlying processes the main focus of the research was made on the regulation of expression through transcription factors TFs the proteins directly binding to DNA On the other hand intensive research is going on in the field of chromatin structure remodeling and its involvement in the regulation Whatever direction we select we can speak about several levels of regulation For instance concentrating on TFs we should consider multiple regulatory layers starting with signaling pathways and ending up with the TF binding sites in the promoters and other regulatory regions However it is obvious that the TF regulation also including the upstream processes represents a modest portion of all processes leading to gene expression For more comprehensive description of the gene regulation we need a systematic and holistic view which brings us to the importance of systems biology approaches Advances in methodology especially in high throughput methods result in an ever growing mass of data which in many cases is still waiting for appropriate consideration Moreover the accumulation of data is going faster than the development of algorithms for their systematic evaluation Data and methods integration is indispensable for the acquiring a systematic as well as a systemic view In addition to the huge amount of molecular or genetic components of a biological system the even larger number of their interactions constitutes the enormous complexity of processes occurring in a living cell organ organism In systems biology these interactions are represented by networks Transcriptional or more generally gene regulatory networks are being generated from experimental ChIPseq data by reverse engineering from transcriptomics data or from computational predictions of transcription factor TF target gene relations While transcriptional networks are now available for many biological systems mathematical models to simulate their dynamic behavior have been successfully developed for metabolic and to some extent for signaling networks but relatively rarely for gene regulatory networks Systems biology approaches provide new perspectives that raise new questions Some of them address methodological problems others arise from the newly obtained understanding of the data
