Christopoulos,A. Wright,1999-06-30 The death of Professor Arthur Wright in the summer of 1996 deprived me of a friend and a colleague whose judgement and experience shaped this book I pay tribute to his contributions to protection

and electrical engineering education In the five years since the first edition appeared many developments have taken place and it is now necessary to update the book The use of digital communications and advanced signal processing techniques is now widespread and several fully numeric relays are available from manufacturers Two new Chapters 13 and 14 have been added to introduce readers to these concepts and associated techniques Artificial intelligence is making its impact in all engineering applications and power system protection is no exception Expert systems fuzzy logic artificial neural networks adaptive and integrated protection synchronized measurements using the global positioning system genetic algorithms flexible a c transmission systems are some of the techniques considered in connection with protection Although many of these techniques have not yet found major application in protection it is nevertheless essential for the educated protection engineer to have a basic understanding of the underlying principles and methodology so that he or she can evaluate their suitability for new relaying problems and applications Chapter 15 was therefore added to guide readers through this developing area I have also added some new material in other chapters to reflect changes over the past years

DIFFERENT PHILOSOPHY USED FOR 95% STATOR EARTH FAULT PROTECTION & IT's SETTING CALCULATION

Akhilesh Kumar Yadav, Hunny Garg, 2020-06-16 Abstract Low voltage generators are solidly grounded or low resistance grounded whereas HV generators are high resistance grounded connected to earth via neutral grounding transformer to limit the stator earth fault current within 5 to 10 Amp When single phase earth fault occurs close to the generator neutral the driving voltage will be low and hence the value of fault current will also be extremely less For faults in the last 5% of the winding from star point the earth fault current is too low that it cannot be detected by protective relay and hence it is very difficult to detect stator earth fault through current based protection Therefore single phase earth fault of stator winding can be protected by using voltage based protections either using Residual over voltage or Neutral voltage displacement protection function There are different philosophies used for detecting earth fault in stator winding In this paper we are showing earth fault setting calculation and its interlock
