**Policy Implications of the Computed Tomography (CT) Scanner**, 1981      **4D Modeling and Estimation of Respiratory Motion for Radiation Therapy** Jan Ehrhardt, Cristian Lorenz, 2013-05-30 Respiratory motion causes an important uncertainty in radiotherapy planning of the thorax and upper abdomen The main objective of radiation therapy is to eradicate or shrink tumor cells without damaging the surrounding tissue by delivering a high radiation dose to the tumor region and a dose as low as possible to healthy organ tissues Meeting this demand remains a challenge especially in case of lung tumors due to breathing induced tumor and organ motion where motion amplitudes can measure up to several centimeters Therefore modeling of respiratory motion has become increasingly important in radiation therapy With 4D imaging techniques spatiotemporal image sequences can be acquired to investigate dynamic processes in the patient's body Furthermore image registration enables the estimation of the breathing induced motion and the description of the temporal change in position and shape of the structures of interest by establishing the correspondence between images acquired at different phases of the breathing cycle In radiation therapy these motion estimations are used to define accurate treatment margins e.g. to calculate dose distributions and to develop prediction models for gated or robotic radiotherapy In this book the increasing role of image registration and motion estimation algorithms for the interpretation of complex 4D medical image sequences is illustrated Different 4D CT image acquisition techniques and conceptually different motion estimation algorithms are presented The clinical relevance is demonstrated by means of example applications which are related to the radiation therapy of thoracic and abdominal tumors The state of the art and perspectives are shown by an insight into the current field of research The book is addressed to biomedical engineers medical physicists researchers and physicians working in the fields of medical image analysis radiology and radiation therapy      Quantitative Analysis in Nuclear Medicine Imaging Habib Zaidi, 2006-07-11 This book provides a review of image analysis techniques as they are applied in the field of diagnostic and therapeutic nuclear medicine Driven in part by the remarkable sophistication of nuclear medicine instrumentation and increase in computing power and its ready and inexpensive availability this is a relatively new yet rapidly expanding field Likewise although the use of nuclear imaging for diagnosis and therapy has origins dating back almost to the pioneering work of Dr G de Hevesy quantitative imaging has only recently emerged as a promising approach for diagnosis and therapy of many diseases An effort has therefore been made to place the reviews provided in this book in a broader context The effort to do this is reflected by the inclusion of introductory chapters that address basic principles of nuclear

medicine instrumentation and dual modality imaging followed by overview of issues that are closely related to quantitative nuclear imaging and its potential role in diagnostic and therapeutic applications A brief overview of each chapter is provided below Chapter 1 presents a general overview of nuclear medicine imaging physics and instrumentation including planar scintigraphy single photon emission computed tomography SPECT and positron emission tomography PET Nowadays patients diagnosis and therapy is rarely done without the use of imaging technology As such imaging considerations are incorporated in almost every chapter of the book The development of dual modality aging systems is an emerging research field which is addressed in chapter 2
