

bearing and stone wall, and a slab, upon which your finished floor will be laid. According to Monte Burch, author of *Complete Guide to Building Log Homes*, even though it requires more concrete than piers, the slab-on-pier foundation may cost less than a post system because it eliminates the need for floor joists.

The general concrete foundation, consisting of a bearing and stone wall is the best option (Figure 8-4). Stone bearing applied to the stone wall creates more uniformly spreading foundation and blends nicely with log walls.

Stone walls can also be constructed from stone (see chapters 4 and 5) or concrete blocks (see chapter 7). Figure 8-5 shows a relatively simple method used to build stone foundations, known as the slip form method. Inlet and outlet pipes are placed along the outside of wooden forms. Concrete is then poured into the forms. When set, the forms are removed and you have what appears to be a smooth stone foundation. (This technique is described in greater detail in chapter 7.)

Foundations can also be made from fly ash concrete, insulated concrete forms, or thermal blocks. Several of these options are discussed in chapter 14. Several of these concrete approaches create a highly insulated foundation and reduce heat consumption, reduce air loss, and save money.

Minimizing the exposed surface of a concrete foundation below grade and protecting it with log finishes are essential for the long-term future of a log home. A good foundation starts in the soil.

Even though log walls are extremely durable, they should be attached to the foundation. If you are building your home on concrete piers or on post-

systems stone wall, sized anchorages can be provided by L-shaped anchor bolts installed in the top of the foundation stone wall (Figure 8-6). If you are using a concrete block foundation, anchor bolts are embedded in concrete piers on the top row of blocks. Anchor bolts penetrate through the first log in the wall, which is usually a smaller, flamed log known as a sill log. They are secured with a washer and nut.

For those interested in learning more about foundations for log homes, read Monte Burch's book, *Complete Guide to Building Log Homes*.

LOG HOME OPTIONS

If you decide to build a log home, you have three options. First, you can hire a professional builder to put up a house for you. Unlike all other natural building strategies, you should find many builders to choose from—unless you live in a desert.

The second option is to purchase a log home kit. This popular approach also has a wide variety of suppliers and kits. For log homes, check out Joe Lipert's book, *Log Homes Made Easy*. Before you go this route, be sure to compare the prices of the logs. If they are being transported from a distant location, consider another option. Check around to find a company that uses locally grown and harvested trees from local forests. This doesn't mean your home contributes to environmental destruction.

Log kits come in three price ranges. The least expensive are the partial kits. They consist of logs for the walls and heavy timbers for the roof and floor. You will have to purchase the rest of the building materials such as trim, windows, and roofing to complete the project.

The mid-range price range are those suppliers who provide "drier-in" shells. These include the materials needed to dry in a house—that is, all of the materials required to build a structure that is protected from rain and snow. The owner is responsible for all the items of housework, including material work. If this option appeals to you, shop around and compare kits before you make any commitments. Before manufacturers go only as far as the roof decking and the upper floors include shingles.

The most expensive log kits supply virtually everything you will need for the walls, floor, windows, and decks. They make your life as simple as possible and reduce the number of trips you need to take to the hardware store. Because many owner-builders are not experienced in home construction, the price is often the most desirable. And even though it may appear to be the most expensive, experience has shown that miscalculating. If you had 10 percent of the normally necessary, it could cost you more. Kit house suppliers often charge volume discounts and pass the savings on part of them on to you. It is important to be certain about the savings or part of them on to you. One of the disadvantages of this approach, however, is that it limits your choice. For example, it may prevent you from using recycled materials. For
