Plug-and-play control of interconnected systems Sven Bodenburg, 2017. In the networked control of interconnected systems the communication network is primarily used for the exchange of measurements amongst the control stations. Plug and play control extends the usage of this network towards the exchange of models with the aim to automatically design control stations at runtime. Therefore every subsystem is equipped with a design agent that initially knows only the model of its subsystem. To design a control station by a design agent first a suitable model of the subsystem that interacts with other subsystems has to be set up. Second local design conditions have to be found that guarantee the adherence of the global control aim. If the designed control station is finally plugged into the control equipment the overall closed loop system plays as desired. The focus of this thesis is to enable the design agent to accomplish the controller design. Therefore three approaches are proposed which focus on the accuracy of the model that is used for the design with respect to the achievable overall closed loop performance. The main result is a novel concept for the self organised controller design by means of design agents. This concept is applied to achieve fault tolerance and to integrate new subsystems. The proposed methods are tested and evaluated through simulations and experiments on a thermofluid process and a multizone furnace.

Windup in Control Peter Hippe, 2006-08-03. Actuator saturation is probably the most frequent nonlinearity encountered in control applications and causes controller windup and plant windup calling for distinct remedies. Peter Hippe presents antiwindup solutions for stable and unstable single input single output and multiple input multiple output MIMO systems. The solutions use only standard tools for the investigation of linear systems: state equations, transfer functions etc. Less rigorous solutions which guarantee improved performance but without strict proof of stability are also demonstrated. Maintenance of MIMO system directionality and bumpless transfer are included and the developments in control methods are always supplemented by easily repeated numerical examples. Academics doing control related research and engineers working in the process industries will find this book an extremely useful overview of systematic windup prevention for all kinds of systems. It also has valuable insights to offer the graduate student of control.

Nonlinear Model Predictive Control Frank Allgöwer, Alex Zheng, 2012-12-06. During the past decade model predictive control (MPC) also referred to as receding horizon control or moving horizon control has become the preferred control strategy for quite a number of industrial processes. There have been many significant advances in this area over the past years, one of the most important ones being its extension to nonlinear systems. This book gives an up to date assessment of the current state of the art in the new field of nonlinear model predictive control (NMPC). The main topic areas that appear to be of central importance for NMPC are covered, namely: receding horizon control theory, modeling for NMPC, computational aspects of on line optimization and application issues. The

book consists of selected papers presented at the International Symposium on Nonlinear Model Predictive Control Assessment and Future Directions which took place from June 3 to 5 1998 in Ascona Switzerland The book is geared towards researchers and practitioners in the area of control engineering and control theory It is also suited for postgraduate students as the book contains several overview articles that give a tutorial introduction into the various aspects of nonlinear model predictive control including systems theory computations modeling and applications

Advanced H ∞ Control Yury V. Orlov, Luis T. Aguilar, 2014-02-20 This compact monograph is focused on disturbance attenuation in nonsmooth dynamic systems developing an H approach in the nonsmooth setting Similar to the standard nonlinear H approach the proposed nonsmooth design guarantees both the internal asymptotic stability of a nominal closed loop system and the dissipativity inequality which states that the size of an error signal is uniformly bounded with respect to the worst case size of an external disturbance signal This guarantee is achieved by constructing an energy or storage function that satisfies the dissipativity inequality and is then utilized as a Lyapunov function to ensure the internal stability requirements Advanced H Control is unique in the literature for its treatment of disturbance attenuation in nonsmooth systems It synthesizes various tools including Hamilton Jacobi Isaacs partial differential inequalities as well as Linear Matrix Inequalities Along with the finite dimensional treatment the synthesis is extended to infinite dimensional setting involving time delay and distributed parameter systems To help illustrate this synthesis the book focuses on electromechanical applications with nonsmooth phenomena caused by dry friction backlash and sampled data measurements Special attention is devoted to implementation issues Requiring familiarity with nonlinear systems theory this book will be accessible to graduate students interested in systems analysis and design and is a welcome addition to the literature for researchers and practitioners in these areas
