Approximation and Complexity in Numerical Optimization Panos M. Pardalos, 2013-06-29 There has been much recent progress in approximation algorithms for nonconvex continuous and discrete problems from both a theoretical and a practical perspective In discrete or combinatorial optimization many approaches have been developed recently that link the discrete universe to the continuous universe through geometric analytic and algebraic techniques Such techniques include global optimization formulations semidefinite programming and spectral theory As a result new approximate algorithms have been discovered and many new computational approaches have been developed Similarly for many continuous nonconvex optimization problems new approximate algorithms have been developed based on semidefinite programming and new randomization techniques On the

other hand computational complexity originating from the interactions between computer science and numerical optimization is one of the major theories that have revolutionized the approach to solving optimization problems and to analyzing their intrinsic difficulty The main focus of complexity is the study of whether existing algorithms are efficient for the solution of problems and which problems are likely to be tractable The quest for developing efficient algorithms leads also to elegant general approaches for solving optimization problems and reveals surprising connections among problems and their solutions A conference on Approximation and Complexity in Numerical Optimization Continuous and Discrete Problems was held during February 28 to March 2 1999 at the Center for Applied Optimization of the University of Florida
