Vector Addition Practice

Show all your work using separate sheets.

For each problem, draw a sketch of the situation and use trigonometry to solve the problem.

To add/subtract vectors numerically by component,

- Clearly sketch the vectors (and their components) on a Cartesian plane. All vectors should be drawn as arrows not lines.
- make a table of the vectors and their components so that the x- and y-components can be added separately to find R_x and R_y
- sketch R_x , R_y and R on a Cartesian plane; find magnitude and direction of R using right triangle trig

1. F_1 and F_2 are vectors shown below (N is a unit of force, it stands for Newton, not north)

- Add the vectors F_1 and F_2 : $F_1 + F_2 = R_1$. Add graphically and numerically
 - Subtract the vector F_2 from F_1 : $F_1 - F_2 = R_2$. Subtract graphically and numerically
2. Alex walks 0.40 km in a direction 60° west of north, then goes 0.50 km due west. Find the displacement by adding the vectors mathematically (by components).
3. A hiker's trip consists of three segments. Path A is 8.0 km long heading 60° north of east. Path B is 7.0 km long in a direction 30° north of west. Path C is 4.0 km long heading 70° east of south. Find the displacement of the hiker.
4. A car drives 60.0 miles directly north in one hour and then turns and drives 80.0 miles directly west in one hour and 15 minutes.
- What is the total distance the car drove?
 - What is the car's total displacement for the trip? (magnitude and direction)
 - What was the car's average velocity for the trip? (magnitude and direction)
 - What was the car's average speed for trip?
