Purpose: to dissect the mussel to develop a better understanding of their anatomy.

Background: Mollusks are some of the most common marine invertebrates. Mollusks have several characteristic features, which include a tissue called the mantle. Mollusks are divided into three groups: cephalopods (octopus and squid), gastropods (snails and slugs), and bivalves (clams and mussels). Bivalves have two shells, or valves, that protect their internal parts. The shells hinge on one side and are held together by strong muscles. Clams are bivalves that spend most of their lives lying on the seafloor. When frightened, a clam uses its wedge-shaped, muscular foot to burrow into the sediment. The clam foot can also help a clam move across the sediments. The soft tissue located just above the foot, the visceral mass, contains a clam's organs. Clams get their nutrition by filtering food particles from water. Fresh sea water is supplied through an incurrent siphon. Water leaves the clam's body and returns to the sea through an excurrent siphon.
