10. Other methods: a. A third, highly sophisticated, alternative approach uses "simulated" data that account for a large number of variables in the model (including "pretreatment" periods) and the timing of the policy change. This method has been used successfully in a number of studies, including the study by Angrist and Pischke (2009) on the effect of a minimum wage increase on the earnings of low-wage workers. b. A fourth method is the "difference-in-differences" (DiD) approach, which compares the change in the outcome variable for the treatment group to the change in the outcome variable for a control group. This method is often used in studies of the effect of policy changes on individual outcomes. c. A fifth method is the "instrumental variables" (IV) approach, which uses a variable that is correlated with the treatment variable but not with the outcome variable to estimate the effect of the treatment. This method is often used in studies of the effect of education on earnings.
