

Catheter placement

Insertion: 10-15 cm
Resting: 10-15 cm
Defecation: 10-15 cm

Resting pressures:

Tracing Problem

- Resting Pves too high

Possible cause

- Catheter may be in the urethra or resting against the bladder wall.
- Catheter may be overcharged.

Check/corrective actions

- Gently advance and/or twist the catheter and move it away from the urethra/bladder wall.
- Slide transducer to OPEN, ask patient to cough several times, repeat Pves (only) slide transducer to CHARGE.
- Ask patient to cough! Valves to ensure proper transmission of pressure.

Tracing Problem

- Resting Pves is too low

Possible cause

- There may be a leak in the connection

Check/corrective actions

- Tighten the connections between the transducers cables and catheter and open and recharge.
- If there is an equal transmission of cough to bladder and rectal readings, adjust catheter to get the reading $\sim 1-3$ of each other then equalize Pabd to Pves.

Tracing Problem

- Pabd decrease after the cough

Possible cause

- Pabd sensor may be too close to the rectal sphincter or in a gas pocket

Check/corrective actions

- Gently advance the abdominal catheter inside the rectum
- Ensure the catheter is taped securely in place as close to the insertion spot as possible

Tracing Problem

- No Pves cough spike

Possible cause

- The Pves transducer may be in the open position
- Catheter not tightened enough and air has escaped from lum lock.
- Catheter may not be in correct place

Check/corrective actions

- Ensure the Pves transducer cable is in charge position.
- Tighten catheter and recharge if necessary
- Check catheter placement and adjust as necessary
- Replace catheter and try again

Tracing Problem

- Pves increases during filling

Possible cause

- Pves may have moved
- Patient may have low bladder compliance

Check/corrective actions

- Check catheter placement and adjust as necessary
- Stop fill and see if Pves decreases

Tracing Problem

- Baseline Pabd is not equal to Pves

Possible cause

- Catheter may not be in the correct position

Check/corrective actions

- Check catheter placement (abdominal catheter first) and adjust as necessary by pulling the catheter back and forth about 1-2 cm to create a tunnel through the pocket of stool
- If this does not work, ask the patient to cough. If there is equal transmission of cough to bladder and rectal reading shown in this tracing, then equalize Pabd to Pves.

Tracing Problem

- Resting Pabd is too high

Possible cause

- Catheter may be against rectal wall/flexure or in rectal sphincter
- Patient may be experiencing a rectal vault contraction
- Catheter may be overcharged

Check/corrective actions

- Gently advance and/or twist the catheter and move it away from the rectal wall/sphincter
- Slide the catheter from the charged position, have the patient cough, slide down to adjust the catheter and follow the procedure to zero the catheter and charge to see if the catheter is positioned
- Pves (cough) and pump and wait for contractions to subside, adjust catheter in and out or bring back to 10 cm to decrease peristalsis
- If there is an equal transmission of cough to bladder and rectal reading, equalize Pabd to Pves

Tracing Problem

- Negative Pabd

Check/corrective actions

- Check catheter placement first by asking patient to cough! Valves
- Check for equal pressure transmission
- Charge position of patient (legs lying to string) if appropriate
- Manipulate the catheter by 1-2 cm increments to create a tunnel in the stool to elicit better pressure transmission
- Equalize Pabd to Pves if appropriate only after a position change at the beginning of the study. The equalize function MUST be used very judiciously

Tracing Problem

- Pves/Pabd cough spikes at different heights

Possible cause

- Either catheter may not be in correct position. Stool catheter may be in the urethra or up against bladder wall or Pabd may be in stool
- Pabd may need to be tightened and recharged

Check/corrective actions

- Check catheter placement and adjust as necessary
- Adjust Pabd in and out
- Pabd lum lock may need to be tightened and recharged
- If Pves is lower than Pabd, start filling the bladder and re-check cough at 30 ml

Tracing Problem

- Pabd line slowly decreases / Pves stable

Possible cause

- The abdominal catheter may have slid downwards
- Patient may have been tense and now relaxing

Check/corrective actions

- Check catheter placement and adjust as necessary
- Check the connection between catheter and transducer cable. Tighten if necessary
- If Pves has not changed since the beginning of the study and there is equal transmission of a cough, equalize Pabd to Pves

Tracing Problem

- Pabd constantly changing, stable Pves

Possible cause

- Abdominal catheter may be in the wrong location
- Patient may be experiencing a rectal contraction/peristalsis

Check/corrective actions

- Check catheter placement and adjust as necessary; if rectal catheter is set to 15 cm pull back to 10 cm for less peristalsis
- Pves pump and wait for contractions to subside
