Optimal operation, configuration and sizing of energy storage and energy conversion technologies for residential house energy systems Tobias Alexander Beck, 2020-06-23 In recent years a rapid growth in the interest in self consumption of electricity generated by distributed electricity generation technologies such as rooftop photovoltaic PV systems has been observed in the residential sector Due to this development future residential house energy systems will face an increased complexity with respect to operation system configuration and sizing of generation and storage technologies In this thesis a mixed integer linear programming model for the integrated operation configuration and sizing of house energy systems is developed and discussed with respect to its applicability to the specifics of self consumption in residential dwellings The conducted scenario analysis shows that over a wide range of assumptions PV

is a robust measure to decrease the total cost of ownership for heat pump and gas boiler based house energy systems The existence of a feed in tariff and the electricity price structure have a much larger influence on the results than the energy price development A feed in tariff generally incentivizes larger PV systems with higher levels of self sufficiency whereas small demand driven PV systems with high levels of self consumption are favored in absence of a feed in tariff Overall the proposed model is regarded as applicable for the identified minimum flexibility requirements for the employed generation technologies The results from the scenario computations provide a clear and robust picture of the role of electricity generation technologies and flexibility options for future house energy systems

An Unlikely Dilemma Goran Gunner, Kjell-Ake Nordquist, 2011-08-01 In a world where armed conflict repression and authoritarian rule are too frequent human rights and peace building present key concepts and agendas for the global and local struggle for peace and development But are these agendas congruent Do they support each other Many organizations states and individuals have experienced how priorities of one agenda create friction with the other For instance are justice and reconciliation incompatible goals If not do they lead to counteracting initiatives How can local and international actors develop support to societies that search a way out of violence and repression without violating universal moral standards in an imperfect and resource scarce situation This study departs from the view that both human rights and peace building are agendas with specific and unique contributions In order to deal with overlapping claims that the two agendas sometimes formulate in both conflict and post conflict situations this study suggests specific approaches in order to create synergy effects of agenda cooperation

Computation and its Limits Paul Cockshott, Lewis M. Mackenzie, Gregory Michaelson, 2012-03-15 Computation and its Limits is an innovative cross disciplinary investigation of the relationship between computing and physical reality It begins by exploring the mystery of why mathematics is so effective in science and seeks to explain this in terms of the modelling of one part of physical reality by another Going from the origins of counting to the most blue skies proposals for novel methods of computation the authors investigate the extent to which the laws of nature and of logic constrain what we can compute In the process they examine formal computability the thermodynamics of computation and the promise of quantum computing
