

OBJECTIVES

The objective of this experiment is to investigate the behavior of two material specimens under a Tensile Test. The materials to be investigated are Copper and Steel. From performing the Tensile Test the following properties will be determined; young's modulus, yield stress, ultimate tensile stress, percentage elongation at fracture, percentage reduction in cross-sectional area at fracture and fracture stress. This experiment is used to determine a material's properties, and is used in a wide range of industries. One example of this could be to determine the Ultimate Tensile Stress of a material to be used for a shopping bag, to check it can hold enough weight.

EQUIPMENT AND METHOD

The two specimens will take the form of a threaded rod with a length of 81.42mm and a diameter of 6.03mm. The test will be performed by placing the two specimens under a "Lloyd test machine". The machine will provide a threaded attachment to connect the specimens. The machine will exert a tensile force on the specimen causing it to extend. The force exerted to create each increment of extension is displayed on the machine along with the total extension. For this test the force exerted for every 0.5mm increment of extension will be recorded.

RESULTS

The Stress-Strain relationships of the two specimens are shown in fig.2. The values for the ultimate tensile stress for the Steel and Copper sample are 536MPa and 445MPa respectively. The Yield Stress for copper is not clearly represented by the graph as it shows the material yielding gradually, but it could be estimated to be at 200MPa by using a 0.1% proof stress. The Yield Stress for steel occurs at 500MPa. The Elastic Modulus for the Steel and Copper samples as calculated from using the Yield Stresses stated previously are both 14.5GPa. Fig.3 shows that after the experiment the Steel sample had elongated 3.5% and the cross sectional area at the point of fracture had decreased by 53.1%. The Copper elongated 6.5%, and the cross sectional area at the point of fracture decreased by 25.9%

DISCUSSION AND CONCLUSION

The Stress-Strain graph shows that the Copper sample experienced more plastic deformation than the Steel sample, and this is reflected by the higher percentage elongation (fig.3).

After it had fractured, the surface of the Copper was rough and irregular. The 2 halves of the fractured sample showed a "cup" and a "cone" shape with an inclination of approximately 45° on their fracture surfaces. In a uniaxial tensile test, this orientation represents the angle of principle shear stress and the surface demonstrates this principle. Shear Stress caused the crystalline boundaries to slip over each other before failure (3).

Fig.3: Dimensions of the sample before and after the test

Material	Steel	Copper
Original Length (mm)	200	200
Length after fracture (mm)	207	213
Percentage Elongation (%)	3.5	6.5
Original Cross Sectional Area (mm ²)	28.6	28.6
Cross Sectional Area after fracture (mm ²)	13.4	21.2
Percentage Reduction in Area (%)	53.1	25.9
