How do ecosystems develop over time?

Why?

On May 18, 1980, Mount St. Helens in the state of Washington erupted with the force of a hydrogen bomb. The volcano had been dormant for over 120 years, but now 57 people were dead and forests and lakes were totally destroyed, including nearby Spirit Lake, which became a mud hole. The blast leveled trees in areas over 10 miles from the crater and ash deposits suffocated life on the mountain. However, within weeks, mammals that had taken shelter underground started to reappear in the area, and now, over thirty years later, many areas of the mountain are colonized with a large variety of plant and animal life. How does an area move from a sterile, barren wilderness to one full of life?

Model 1 – Primary Succession

Barren rock from beneath a retreating glacier, or due to a volcanic eruption.

Low-growing plants such as mosses, ferns, and lichens begin to colonize.

Fast-growing grasses, flowering plants, and small shrubs begin to take root. A thin layer of soil develops.

Fast-growing trees such as birch and mountain ash form a low forest and shade out lower plants.

100–200 years since colonization began, large, slow-growing trees, such as an oak, become established.

Beyond Naturalness David N. Cole,Laurie Yung,2012-06-22 The central concept guiding the

management of parks and wilderness over the past century has been naturalness to a large extent the explicit purpose in establishing these special areas was to keep them in their natural state But what does that mean particularly as the effects of stressors such as habitat fragmentation altered disturbance regimes pollution invasive species and climate change become both more pronounced and more pervasive Beyond Naturalness brings together leading scientists and policymakers to explore the concept of naturalness its varied meanings and the extent to which it provides adequate guidance regarding where when and how managers should intervene in ecosystem processes to protect park and wilderness values The main conclusion is the idea that naturalness will continue to provide an important touchstone for protected area conservation but that more specific goals and objectives are needed to guide stewardship The issues considered in Beyond Naturalness are central not just to conservation of parks but to many areas of ecological thinking including the fields of conservation biology and ecological restoration and represent the cutting edge of discussions of both values and practice in the twenty first century This book offers excellent writing and focus along with remarkable clarity of thought on some of the difficult questions being raised in light of new and changing stressors such as global environmental climate change Science Insights ,1999

Bioassessment of Freshwater Ecosystems Robert C. Bailey,Richard H. Norris,Trefor B. Reynoldson,2012-12-06 Aquatic ecosystem assessment is a rapidly developing field and one of the newer approaches to assessing the condition of rivers and lakes is the Reference Condition Approach This is a significant advancement in biomonitoring because it solves the problem of trying to locate nearby control or reference sites when studying an ecosystem that may be degraded a problem

that bedevils traditional approaches Rather than using upstream reference sites in a river system or next bay over reference sites in a lake an array of ecologically similar least exposed to stress sites scattered throughout a catchment or region is used Once the reference condition has been established any site suspected of being impacted can be assessed by comparison to the reference sites and its status determined The Reference Condition database once formed can be used repeatedly
