Cellular and Molecular Mechanisms Underlying the Pathogenesis of Hepatic Fibrosis Ralf Weiskirchen, 2020-12-29 Worldwide liver fibrosis is a major cause of morbidity and mortality and is associated with a high medical and economic burden It is the common consequence of chronic liver injury due to various

etiologies During fibrogenesis there is a progressive substitution of the liver parenchyma by scar tissue Recent advances in the understanding of the history of liver fibrosis have shown that the pathogenesis is driven by different cell types and a large variety of soluble mediators At present scientists working in this field aim to increase basic knowledge improve diagnostics and try to translate experimental findings into new treatment modalities This book includes 12 selected contributions from the Special Issue Cellular and Molecular Mechanisms Underlying the Pathogenesis of Hepatic Fibrosis that was published in Cells These articles summarize current perspectives and findings in hepatic fibrosis research showing how scientists try to use basic scientific research to create new therapies and diagnostics

Diabetic Kidney Disease: Routes to drug development, pharmacology and underlying molecular mechanisms, volume II Swayam Prakash Srivastava, Divya Bhatia, 2025-05-07 This exciting Research Topic is the second volume of the Research Topic Diabetic Kidney Disease Routes to drug development pharmacology and underlying molecular mechanisms Please see the first volume here Diabetic kidney disease is a leading cause of end stage renal disease which affects one third of the total diabetic patients worldwide Diabetic kidney disease is also one of the significant long term complications in terms of morbidity and mortality for individuals with diabetes A serious knowledge gap exists between biology and drug development which contributes to the suboptimal treatment options against diabetic nephropathy An increased understanding of diabetic kidney disease is urgently needed for the development of novel therapeutics that can be targeted to the early stages of these diseases Currently approved therapeutic regimens can slow down but not prevent the progression of end stage kidney disease and are associated with side effects and intolerance Thus there is a clear need for new therapeutic strategies to

improve renal function in diabetic patients

Plant Proteases Mercedes Diaz-Mendoza, Juan Guamet, Frank Van

Breusegem, 2020-01-24 Plant proteases are involved in most aspects of plant physiology and development playing key roles in the generation of signaling molecules and as regulators of essential cellular processes such as cell division and metabolism. They take part in important pathways like protein turnover by the degradation of misfolded proteins and the ubiquitin proteasome pathway and they are responsible for post translational modifications of proteins by proteolysis at highly specific sites. Proteases are also implicated in a great variety of environmentally controlled processes including mobilization of storage proteins during seed germination, development of seedlings, senescence, programmed cell death and defense mechanisms against pests and pathogens. However, in spite of their importance, little is known about the functions and mode of actions of specific plant proteases. This Research Topic collects contributions covering diverse aspects of plant proteases research.

Aging and Age-Related Disorders

Stephen Bondy, Kenneth Maiese, 2010-09-02 Features that characterize the aging process include the gradual accumulation of cell damage after prolonged exposure to oxidative and inflammatory events over a lifetime. In addition to the accretion of lesions, the intrinsic levels of pro oxidant and aberrant immune responses are elevated with age. These adverse events are often further enhanced by the chronic and slow progressing diseases that characterize the senescent brain and cardiovascular system. The incidence of some disorders such as Alzheimer's disease and vascular diseases are sufficiently prevalent in the extreme elderly that these disorders can arguably be considered normal. Aging and Aging Related Disorders examines the interface between normal and pathological aging and illustrates how this border can sometimes be diffuse. It explores and illustrates the processes underlying the means by which aging becomes increasingly associated with inappropriate levels of free radical activity and how this can serve as a platform for the progression of age related diseases. The book provides chapters that examine the interactive relationship between systems in the body that can enhance or sometimes even limit cellular longevity. In addition, specific redox mechanisms in cells are discussed. Another important aspect for aging discussed here is the close relationship between the systems of the body and exposure to environmental influences of oxidative stress that can affect both cellular senescence and a cell's nuclear DNA. What may be even more interesting to note is that these external stressors are not simply confined to illnesses usually associated with aging but can be evident in maturing and young individuals. A broad range of internationally recognized experts have contributed to this book. Their aim is to successfully highlight emerging knowledge and therapy for the understanding of the basis and development of aging related disorders.
