Griffith, Christopher J. Still, Colin P. Osborne, 2019-08-02 Early biogeographers such as Alexander von Humboldt recognized the broad scale coupling of vegetation and climate This observation shaped the modern biome concept which organizes ecosystems by assumed relationships to environmental controls This approach has been criticized for missing key impacts on the distribution and functioning of biomes like historical contingency biogeographic history disturbance ecology and evolution Are biomes still a convenient framework for organizing our understanding of biodiversity What factors determine the functional differences among and within biomes and at what spatial temporal and phylogenetic scales are those drivers most important How can we better represent the functional characteristics and dynamics of ecosystems This Research Topic highlights the latest discussions and research on biomes drawing from a wide range of approaches spanning from macroecology and phylogeography to remote sensing and modelling ecosystem responses to global change **Introduction to Biomes** Susan L. Woodward, 2008-11-30 Introduction to Biomes is both a standalone summary to the concept of biomes and an introduction to the 8 volume series Greenwood Guides to Biomes of the World The volume covers The biome concept and brief descriptions of vegetation climate and distribution of the terrestrial and of the range of freshwater and aquatic biomes covered in the set Classifying life how scientists discuss the taxonomic hierarchy and how it has been used to determine how to divide the world into regions based on living organisms The ecosystem concept how this and other major concepts from ecology that are key to understanding biomes Terrestrial environments the various climatic variables and climate types and a discussion of our changing planet Aquatic environments and life how lifeforms and food chains make aquatic environments distinct from terrestrial biomes Maps photos diagrams drawings and tables accompany the text as do sidebars that highlight habitats species and ecological relationships The volume includes a bibliography of accessible resources for further research **From Principles of**

Analysis of PADDD: an environmental econometric application Gláucio Costa de Menezes, Isabel Lausanne Fontgalland, The environment has always been a great source of raw material for humanity whether this matter is of plant animal or mineral origin The vast majority of needs are met through factor factor and factor product correlations which indicate in their genesis the nature of economic development However numerous scientific works especially those produced by scholars of the economic sciences demonstrate that some resources made available by nature are finite and it should therefore be sought to develop strategic measures so that their use occurs in the most rational way possible Among these strategies is since the 1970s the creation and dissemination of so called protected areas whose main scope is the preservation of the environment for future generations

Zonal Biomes of Southern Africa Ladislav Mucina, Michael C. Rutherford, 2024-09-28 This book is the first comprehensive account of large scale ecosystems biomes of Southern Africa defined as area south of the Kunene and Zambezi Rivers It addresses the diversity of biomes in one of the most biodiverse regions of the world comprising South Africa Namibia Botswana Zimbabwe southern part of Mozambique Eswatini and Lesotho It has adopted a novel hierarchical biome classification approach The biomes at four levels of complexity are identified described and mapped using modern GIS assisted mapping technology The structure of the book and its comprehensive nature makes this product of prime interest to teachers and students of all tertiary education levels as well as to scientists in the fields of ecology biodiversity science and bioclimatology It is poised to serve as a major reference book and handbook for the users in these scientific fields

Earth Environments David Huddart, Tim A. Stott, 2020-01-07 Comprehensive coverage of the whole Earth system throughout its entire existence and beyond. Complete with a new introduction by the authors, this updated edition helps provide an understanding of the past, present, and future processes that occur on and in our Earth: the fascinating yet potentially lethal set of atmospheric, surface, and internal processes that interact to produce our living environment. It introduces students to our planet's four key interdependent systems: the atmosphere, lithosphere, hydrosphere, and biosphere, focusing on their key components, the interactions between them, and environmental change. The book also uses geological case studies throughout, in addition to the modern processes. Topics covered in the Second Edition of Earth Environments: Past, Present, and Future include an Earth systems model, components, systems, and processes; atmospheric systems; oceanography; surface and internal geological systems; biogeography; and aspects of Earth's record. The book also discusses the impact of climate and environmental change in a final chapter that draws together Earth's systems and their evolution and looks ahead to potential future changes in Earth's environments. Updated to include all the major developments since 2008, Features research boxes containing summaries based on recent key journal articles. Includes a companion web site containing multiple choice revision quizzes for students, PowerPoint slides for lecturers, useful links, and more. Presents further reading for each topic so that students can build their knowledge base to underpin their own undergraduate research project or dissertation. Offers additional case studies in each chapter for enhanced reader understanding. Earth Environments: Past, Present, and Future is an excellent text for undergraduates in geosciences, environmental science, physical geography, natural hazards, and ecology.

International Law and Agroecological Husbandry John W. Head, 2016-11-25 Remarkable advances are being made in life science and agricultural research to reform the methods of food production particularly with regard to staple grain and legume crops in ways that will better reflect ecological realities However advances in science may be insufficient to ensure that these possibilities for agricultural reform are realized in practice and in a sustainable way This book shows how these can only be achieved through changes in legal norms and institutions at the global level Interdisciplinary in character the book draws from a range of issues involving agricultural innovation international legal history and principles treaty commitments global institutions and environmental challenges such as climate change to propose broad legal changes for transforming global agriculture It first shows how modern extractive agriculture is unsustainable on economic environmental and social grounds It then examines the potential for natural systems agriculture especially perennial polyculture systems for overcoming the deficiencies of modern extractive agriculture especially to offset climate change Finally it analyses closely the legal innovations that can be adopted at national and international levels to facilitate a transition from modern extractive agriculture to a system based more on ecological principles In particular the author argues for the creation of a Global
