from Installation to Database Management and Database Administration Anything that stores data records is called a database It can be a file CD hard disk or any number of storage solutions From a programming point of view a database is a methodically structured repository of indexed data information that can be easily accessed by the users for creating retrieving updating and deleting information Data can be stored in many forms Most applications require a database for storing information A database can be of two types 1 flat database and 2 relational database As the name suggests a flat database has a two dimensional structure that has data fields and records stored in one large table It is not capable of storing complex information which creates a need for relational databases A relational database stores data in several tables that are related to each other Let s take the example of a school A school will have to maintain data for several students To find information for a student we will first ask the class name After the class name we will ask for the first name However if there are two children with the same first name then we will ask for the surname If there are two children with identical names we can still discriminate the information related to them based on their student id parents name date of birth siblings in the same school etc This is all related information When all of this information is stored on paper it takes a lot of time to retrieve it The relational database allows easy access to all of this information SQL is a computer language we can use to work with the various database management systems It is the standard language for the various relational database management systems such as Oracle MySQL MS Access SQL Server Postgres Sybase etc With the use of SQL a database user can create various database objects and perform various manipulations on them When they have accomplished the tasks they were using the objects for the users can drop these database objects A good example of a database object is a table which is a combination of rows and columns Tables allow us to group our data into rows and columns SQL allows you to create a table insert data into it manipulate this data and even drop it when you are done with its use Besides this SQL allows you to impose constraints on the table to restrict the data that can be inserted into that table You must have data you need to store well The data should be safeguarded against loss If the data is sensitive you need to safeguard it so it doesn t land into the wrong hands You also need a way of organizing this data so it becomes easy for you to retrieve it You only need to get a database management system and SQL will help you achieve all of this This book is an excellent guide for you to learn SQL It explores everything about this computer database language Having said that take a step ahead and purchase a copy of this book to enjoy more information Scroll Up To The Top Of The Page And Click The Buy Now Icon SQL John Russel, 2019-11-22
