### DELAY POOL PARAMETERS

Conceptually, delay pools are bandwidth buffers - "pools" of bandwidth that drain out as people browse the Web, and fill up at the rate specified - this can be thought of as a leaky bucket that is continuously being filled. This is useful when bandwidth changes are in place, if you want to reduce bandwidth usage through traffic.

Delay Pools can be useful when combined with ACLs. These tags permit us to limit the bandwidth of certain requests, based on any criteria. Delay buckets selected by ACLs (for and high priority traffic, staff vs students or student vs authenticated student or so on). In ISPs, delay pools can be implemented in a particular network to improve the quality of service. To enable this, Squid needs to be configured with the `enable_delay_pools` option.
