VLSI processes The reliable operation of integrated circuits ICs has become increasingly difficult to achieve in the deep submicron DSM era With continuously decreasing device feature sizes combined with lower supply voltages and higher operating frequencies the noise immunity of VLSI circuits is decreasing alarmingly Thus VLSI circuits are becoming more vulnerable to noise effects such as crosstalk power supply variations and radiation induced soft errors Among these noise sources soft errors or error caused by radiation particle strikes have become an increasingly troublesome issue for memory arrays as well as combinational logic circuits Also in the DSM era process variations are increasing at a significant rate making it more difficult to design reliable VLSI circuits Hence it is important to efficiently design robust VLSI circuits that are resilient to radiation particle strikes and process variations The work presented in this research monograph presents several analysis and design techniques with the goal of realizing VLSI circuits which are radiation and process variation tolerant
