Ariel, 2012-12-06 The most meaningful reward to clinicians and researchers is the absence of recurrent malignancy in their patients While in some patients the disease will be cured by resection alone in other similarly staged cases the disease will recur despite adequate loco regional and systemic therapies Hence risk assessment is a complex issue with many related or unrelated prognostic factors determining outcome The purpose of this volume is to review some of the most relevant prognostic factors of newly diagnosed breast cancer focusing on features determining the magnitude of risk The ultimate

value of establishing the significance of each prognostic factor in a given patient will be the resulting ability to plan individualized therapies for patients at different risk of recurrence at the time of diagnosis. To secure the maximum benefit for high risk patients while avoiding undue toxicity in those with low risk lesions, a well integrated analysis of all known prognostic factors will be essential in the early postdiagnostic period. In addition to well established staging criteria such as axillary nodes, tumor size, receptors, scanning and radiographic examinations, the more sophisticated laboratory techniques as discussed by several authors herein will play a crucial role in risk assessment. Most of them, ploidy determination, oncogenes, tumor markers, monoclonal antibodies, growth factors etc, are presently available in only a minority of treatment centers.
