

Introduction
 The purpose of this study is to investigate the effects of a new educational program on student performance. The program is designed to improve critical thinking and problem-solving skills through a series of interactive modules. The study will involve a group of students who will participate in the program and a control group that will not. Data will be collected at the beginning and end of the program to measure changes in performance. The results of the study will be used to inform future educational practices and to determine the effectiveness of the program.

Methodology
 The study will use a quasi-experimental design. A group of students will be selected to participate in the program, while a control group will be selected from the same population. The program will be implemented over a period of eight weeks. Data will be collected at the beginning and end of the program. The results will be analyzed using statistical methods to determine if there is a significant difference between the two groups.

Results and Discussion
 The results of the study show that the program had a positive effect on student performance. The students who participated in the program showed a significant increase in critical thinking and problem-solving skills compared to the control group. This suggests that the program is effective in improving these skills. The discussion of the results will focus on the factors that contributed to the success of the program and the implications for future research.

Conclusion
 The study concludes that the new educational program is effective in improving student performance. The program should be implemented in other schools to ensure that all students have access to this valuable educational resource. Further research is needed to explore the long-term effects of the program and to identify ways to enhance its effectiveness.
