## Unit 3 Study Guide - Integumentary System

1. What type of tissue makes up the epidermis? \_\_\_\_\_
2. What types of tissue make up the dermis? \_\_\_\_\_
3. What is the primary tissue type in the hypodermis? Adipose (connective)
4. What are the functions of the skin?

**Protection** - barrier between your body and the outside world, protects against water, air, infection, chemicals, UV radiation

**Sensations** - pressure, heat, cold, and pain

**Temperature Regulation** - helps maintain body temperature homeostasis through sweating and blood flow

**Excretion** - sweat out waste products

**Production of vitamin D** with the help of UV radiation

5. What determines the level of pigmentation in a person's skin? What are the benefits of both light and dark skin in relation to UV radiation?

The number of melanocytes (melanin-producing cells) is relatively stable so the variation in skin color comes from the amount and type of melanin produced by an individual's melanocytes. Light skin is better equipped to be able to make vitamin D because there is less protection against UV radiation. Darker skin tones have more melanin which is better able to protect folate levels and prevent skin cancer.

6. What types of cells are found in the epidermis and what are their main functions?

**Keratinocytes** - produce a fibrous protein called keratin which is used to create a tough outer barrier

**Dendritic cells (Langerhans)** - macrophages that help with the immune response

**Tactile cells (Merkel)** - sensory cells that detect extremely light touch

**Melanocytes** - produce melanin pigment for protection against UV radiation

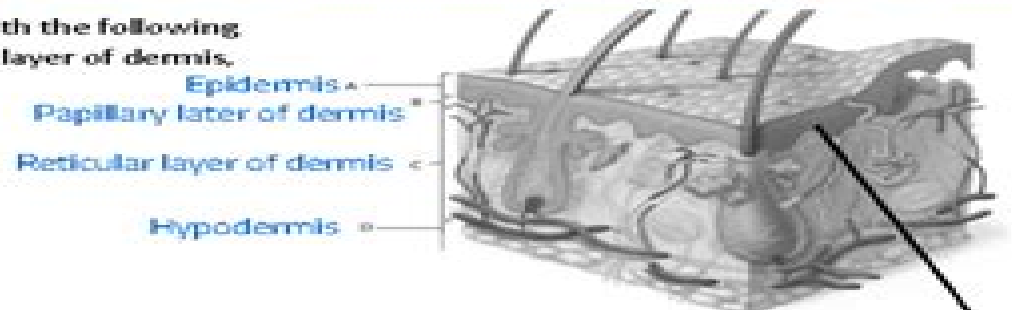

7. List the layers of the epidermis in order from the most superficial to deep. (Hint: Come, Let's Get Sun Bum).

(Top layer) Stratum corneum, stratum lucidum, stratum granulosum, stratum spinosum, stratum basale (bottom layer)

8. In terms of both structure and benefit, explain why surface keratinocytes are dead.

The epidermis does not contain blood vessels which means the necessary resources don't reach the upper layers of the keratinocytes. The upper two layers (stratum corneum and stratum lucidum) therefore have mostly dead keratinocytes. This is also helpful for the skin because it creates a tough outer barrier to protect the skin layers below.

9. Label the diagram to the right with the following terms: hypodermis, epidermis, reticular layer of dermis, papillary layer of the dermis

10. Describe or draw the three patterns of fingerprints. What forms the dermal papillae that result in fingerprints?

Arch

L

The wavy dermal papillae that create your visible fingerprints are formed between the deepest layer of the epidermis (stratum basale) and the most superficial dermis (papillary layer).
