Gould,2020-07-21 This book provides an understanding of the theoretical foundations for the calculation of electromagnetic processes Photon production processes are particularly important in astrophysics since almost all of our knowledge of distant astronomical objects comes from the detection of radiation from these sources Further the conditions therein are extremely varied and a wide variety of naturally occurring electromagnetic phenomena can be described by limiting forms of the basic theory The first chapter reviews some basic principles that are the underpinnings for a general description of electromagnetic phenomena such as special relativity and especially relativistic covariance Classical and quantum electrodynamics QED are then formulated in the next two chapters followed by applications to three basic processes Coulomb scattering Compton scattering and bremsstrahlung These processes are related to other phenomena such as pair production and the comparisons are discussed A unique feature of the book is its thorough discussion of the nonrelativistic limit of QED which is simpler than the relativistic theory in its formulation and applications The methods of the relativistic theory are introduced and applied through the use of notions of covariance to provide a shorter path to the more general theory The book will be useful for graduate students working in astrophysics and in certain areas of particle physics **Scientific and Technical Aerospace Reports** ,1991-05

There is also coverage of more specialized topics such as advanced quantum mechanics particle physics field theory condensed matter physics and astrophysics and gravitation Many worked examples are included as well as an extensive array of end of chapter problems with a solution manual available to instructors In addition to covering the standard topics in the undergraduate curriculum the book explores how dimensional analysis has been used and continues to be used in research across all fields of physics citing examples from the historical literature and from very recent research results The work includes extensive references to the original papers for further study as well as useful ancillary material including a dimensional analysis dictionary brief introductions to data fitting and connections to metrology There is an emphasis throughout on the use of modern symbolic programming to streamline the process of the solving systems of linear equations needed for a dimensional analysis approach with several Mathematica templates provided for reader use
