

Unifying Themes in the Study of Biology

Biology comes from the words *bios* which means life and *logos* which means to know. It is the systematic study of living things. Biological science is vast. It deals with the smallest component of the living system to the biosphere. It attempts to understand how living things function, reproduce, metabolize and evolve over time. The vast information resulting from inquiries in the field of biology may be organized into five unifying themes.

Theme 1: Emergent properties develop at each level of the Biological Hierarchy.

Emergent properties are properties that are present in the biological level but not present in the preceding level. These properties are results of the arrangement and interactions of biological components. Think of a bicycle. The bicycle has wheels, pedals, chain and sprockets. None of these parts, on their own, can be ridden. Even a complete set of bicycle parts cannot be ridden unless the parts are arranged in a specific manner which allows the correct interaction of the parts. The property of the bicycle "bicycle can be ridden" is an emergent property that is not present in the individual parts. A muscle, such as the triceps, has the ability to contract but it cannot perform complex tasks such as throwing a ball or running. These functions are emergent properties present in the organismal level but not in the organ level.

Triceps Brachii

The human triceps can contract to extend the forearm, a function that is antagonistic to the function of the biceps brachii.
