

Anatomy of the Respiratory System

Respiration

Respiration is the act of breathing:

- **Inhaling.** The act of breathing in oxygen.
- **Exhaling.** The act of breathing out carbon dioxide.

Respiratory system

The respiratory system is made up of the organs included in the exchange of oxygen and carbon dioxide. These are the parts:

- Nose
- Mouth
- Throat (pharynx)
- Voice box (larynx)
- Windpipe (trachea)
- Large airways (bronchi)
- Lungs

The **upper respiratory** tract is made up of the:

- Nose
- Nasal cavity
- Sinuses
- Larynx
- Trachea

The **lower respiratory** tract is made up of the:

- Lungs
- Bronchi and bronchioles
- Air sacs (alveoli)

Lungs

The lungs take in oxygen. The cells of your body's cells need oxygen to live and carry out their normal functions. The lungs also get rid of carbon dioxide, a waste product of the cells.

The lungs are a pair of cone-shaped organs made up of spongy, pinkish-gray tissue. They take up most of the space in the chest (thorax).

The lungs are surrounded by a membrane (pleura).

The lungs are separated from each other by the mediastinum, an area that contains the:

- Heart and its large vessels
- Trachea
- Esophagus
- Thymus gland
- Lymph nodes

The right lung has 3 sections, called lobes. The left lung has 2 lobes. When you breathe:

- Air enters your body through your nose or mouth.
- Air then travels down the throat through the larynx and trachea.
- Air goes into the lungs through tubes called main-stem bronchi. One main-stem bronchus leads to the right lung and one to the left lung:
- In the lungs, the main-stem bronchi divide into smaller bronchi.
- The smaller bronchi divide into even smaller tubes (bronchioles).
- Bronchioles end in tiny air sacs (alveoli) where the exchange of oxygen and carbon dioxide occurs.

Drug Discovery and Evaluation: Safety and Pharmacokinetic Assays Franz J. Hock,Michael K. Pugsley,2024-10-21 Many aspects of drug safety have become an outstanding and even persistent issue and may occur during the process of both drug discovery and development Until 15 years ago drug discovery and evaluation was

primarily a sequential process starting with the selection of the most pharmacologically active compound from a series of newly synthesized small molecule chemical series by means of distinctive pharmacological assays. Safety aspects were addressed by evaluation of the selected compound at high doses in a series of specific studies directed at indications other than the intended indication of the new compound. These tests are then followed by pharmacokinetic studies which are primarily conducted to confirm whether the selected compound possesses a suitable half life for sufficient exposure and efficacy and whether it has the desired properties specificity to the intended route of administration. Safety aspects relied predominantly on the conduct of single and repeat toxicology dose studies which inform changes in organ structure rather than organ function. Both toxicological and pharmacokinetic studies are adapted to the progress of studies in clinical pharmacology and clinical trials. The new edition of this well and broadly accepted reference work contains several innovative and distinguished chapters. This sequential strategy has been abandoned with this new version of the book for several reasons. Of the possible multitude of negative effects that novel drugs may impart on organ function e.g. ventricular tachy arrhythmia many are detected too late in non clinical studies to inform clinicians. On the other hand negative findings in chronic toxicity studies in animals may turn out to be irrelevant for human beings. New scientific approaches e.g. high throughput screening human pluripotent stem cells transgenic animals knock out animals in silico models pharmacogenomics and pharmacoproteomics as well as Artificial Intelligence AI methods offered new possibilities. There are several examples that show that the druggability of compounds was considerably underestimated when the probability of success of a new project was assessed. The success rate in the pharmaceutical industry and the introduction of new chemical entities to the market per year dropped dramatically whereas the development time for a new compound increased sometimes exceeding the patent protection. Research and development scientists involving the following changes therefore adopted a change of strategy. Parallel instead of sequential involvement of the various disciplines multidimensional compound optimization. The term Safety Pharmacology was coined. The International Conference on Harmonization ICH founded a Safety Pharmacology Working Group and the Safety Pharmacology Society SPS was launched. The discipline provided for evaluation development and validation of a multitude of safety tests outlined in the Core Battery of Studies. Characterizing the exposure profile of a drug by conducting pharmacokinetic studies that evaluates the absorption distribution metabolism and excretion should to be investigated at an early stage of development as results contribute to the selection of a compound for further development. Advancements in Toxicology were achieved by the introduction of new methods e.g. in silico methods genetic toxicology computational toxicology and AI. The book is a landmark in the continuously changing world of drug research and developments. As such it is essential reading for many groups not only for all students of pharmacology and toxicology but also for industry scientists and physicians especially those involved in clinical trials of drugs and for pharmacists who must know the safety requirements of drugs. The book is essential for scientists and managers in the

pharmaceutical industry who are involved in drug discovery drug development and decision making in the development process In particular the book will be of use to government institutions and committees working on official guidelines for drug evaluation worldwide *Building a Medical Vocabulary - E-Book* Peggy C.
