Evolution

Q: What is natural selection?

18.1 What patterns of biodiversity did Darwin observe around the world?

WHAT I KNOW

Learn's answer: On each island that Darwin visited, he saw different species of plants and animals.

WHAT I LEARNED

Learn's answer: Darwin noticed that different, yet similar, species inhabited separate, but similar, habitats around the globe. Also, different, yet related, species often occupied different habitats within a local area.

18.2 How did other scientists' work help Darwin develop his theory of natural selection?

Learn's answer: Other scientists' and researchers' on how organisms behaved differed greatly.

Learn's answer: Hutton and Lyell concluded that Earth is extremely old. Lamarck suggested that species are not fixed. Malthus reasoned larger populations would deplete resources.

18.3 What is Darwin's theory of evolution by natural selection?

Learn's answer: Organisms that are best adapted to their environment survive longest and have more offspring.

Learn's answer: Natural selection is the process by which organisms with variations most suited to their local environment survive and have more offspring. Over time, beneficial traits accumulate in a population.

18.4 What are the main lines of scientific evidence that support Darwin's theory of evolution by natural selection?

Learn's answer: Fossils show how organisms have changed over time.

Learn's answer: Biogeography, fossils, homologous structures, vestigial structures, embryological development, the universal genetic code, analogous molecules, and field studies provide evidence of evolution.

Muller, 2010-03-26 Prominent evolutionary biologists and philosophers of science survey recent work that expands the core theoretical framework underlying the biological sciences In the six decades since the publication of Julian Huxley's *Evolution: The Modern Synthesis* the spectacular empirical advances in the biological sciences have been accompanied by equally significant developments within the core theoretical framework of the discipline As a result evolutionary theory today includes concepts and even entire new fields that were not part of the foundational structure of the Modern Synthesis In this

volume sixteen leading evolutionary biologists and philosophers of science survey the conceptual changes that have emerged since Huxley's landmark publication not only in such traditional domains of evolutionary biology as quantitative genetics and paleontology but also in such new fields of research as genomics and EvoDevo. Most of the contributors to *Evolution: The Extended Synthesis* accept many of the tenets of the classical framework but want to relax some of its assumptions and introduce significant conceptual augmentations of the basic Modern Synthesis structure just as the architects of the Modern Synthesis themselves expanded and modulated previous versions of Darwinism. This continuing revision of a theoretical edifice the foundations of which were laid in the middle of the nineteenth century the reexamination of old ideas proposals of new ones and the synthesis of the most suitable shows us how science works and how scientists have painstakingly built a solid set of explanations for what Darwin called the grandeur of life.
