AP Biology

Name: Angela Yang

The diagram below shows the translation phase of protein synthesis. The diagram shows how a single mRNA molecule can be 'serviced' by many ribosomes at the same time. The ribosome to the right is in a more advanced stage of constructing a polypeptide chain because it has 'translated' more of the mRNA than the ribosome to the left. The anti-codon at the base of each tRNA must make a perfect complementary match with the codon on the mRNA before the amino acid is released. Once released, the amino acid is added to the growing polypeptide chain by enzymes.
