

VULNERABILITY

A vulnerability in a system, software or service is found by an individual who decides to keep it a secret from the vendor.

EXPLOIT

Knowledge of the vulnerability is then used by either the person discovering it or a partner or contact to develop "exploit code" that is able to leverage the vulnerability.

ATTACK

The exploit is then used to perform one or more attacks on vulnerable systems.

DAY ZERO

"Day zero" is the day the vendor learns of the vulnerability and begins working on a fix.

Network Security Metrics Lingyu Wang,Sushil Jajodia,Anoop Singhal,2017-11-15 This book examines different aspects of network security metrics and their application to enterprise networks One of the most pertinent issues in securing mission critical computing networks is the lack of effective security metrics which this book discusses in detail Since you cannot improve what you cannot measure a network security metric is essential to evaluating the relative effectiveness of potential network security solutions The authors start by examining the limitations of existing solutions and standards on security metrics such as CVSS and attack surface which typically focus on known vulnerabilities in individual software products or systems The first few chapters of this book describe different approaches to fusing individual metric values obtained from CVSS scores into an overall measure of network security using attack graphs Since CVSS scores are only available for previously known vulnerabilities such approaches do not consider the threat of unknown attacks exploiting the so called zero day vulnerabilities Therefore several chapters of this book are dedicated to develop network security metrics especially designed for dealing with zero day attacks where the challenge is that little or no prior knowledge is available about the exploited vulnerabilities and thus most existing methodologies for designing security metrics are no longer effective Finally the authors examine several issues on the application of network security metrics at the enterprise level Specifically a chapter presents a suite of security metrics organized along several dimensions for measuring and visualizing different aspects of the enterprise cyber security risk and the last chapter presents a novel metric for measuring the operational effectiveness of the cyber security operations center CSOC Security researchers who work on network security or security analytics related areas seeking new research topics as well as security practitioners including network administrators and security architects who are looking for state of the art approaches to hardening their networks will find this book helpful as a reference Advanced level students studying computer science and engineering will find this book useful as a secondary text

Mathematical Modeling of the Immune System in Homeostasis, Infection and Disease Gennady Bocharov,Burkhard Ludewig,Andreas Meyerhans,Vitaly Volpert,2020-02-24 The immune

system provides the host organism with defense mechanisms against invading pathogens and tumor development and it plays an active role in tissue and organ regeneration. Deviations from the normal physiological functioning of the immune system can lead to the development of diseases with various pathologies including autoimmune diseases and cancer. Modern research in immunology is characterized by an unprecedented level of detail that has progressed towards viewing the immune system as numerous components that function together as a whole network. Currently we are facing significant difficulties in analyzing the data being generated from high throughput technologies for understanding immune system dynamics and functions, a problem known as the curse of dimensionality. As the mainstream research in mathematical immunology is based on low resolution models, a fundamental question is how complex the mathematical models should be. To respond to this challenging issue, we advocate a hypothesis driven approach to formulate and apply available mathematical modelling technologies for understanding the complexity of the immune system. Moreover, pure empirical analyses of immune system behavior and the system's response to external perturbations can only produce a static description of the individual components of the immune system and the interactions between them. Shifting our view of the immune system from a static schematic perception to a dynamic multi level system is a daunting task. It requires the development of appropriate mathematical methodologies for the holistic and quantitative analysis of multi level molecular and cellular networks. Their coordinated behavior is dynamically controlled via distributed feedback and feedforward mechanisms which altogether orchestrate immune system functions. The molecular regulatory loops inherent to the immune system that mediate cellular behaviors e.g. exhaustion, suppression, activation and tuning can be analyzed using mathematical categories such as multi stability, switches, ultra sensitivity, distributed system, graph dynamics or hierarchical control.
