Multi-physics FEM, modal analysis and correlation

The Structural Dynamics Toolbox brings Finite Element Modeling and Experimental Modal Analysis capabilities to the MATLAB environment.

Easy adaptation to specific user needs is obtained by a complete integration in the MATLAB programming environment and the ability to perform modifications through both GUI and script. This capability is a major reason to choose SDT over competing programs that can't be customized or extended as easily. The SDT-Runtime license and MATLAB Compiler allow large scale deployment of custom applications.

State of the art performance in FEM analysis is obtained through compiled (mex) files for element level computations and sparse solvers.

The FEMLink interface is used to pre/post-process computations in other FEM software, import results for test/analysis correlation or state-space model building, run mixed software solutions through the use of superelements.

**Dynamic Methods for Damage Detection in Structures** Antonino Morassi, Fabrizio Vestroni, 2008-12-11 Non destructive testing aimed at monitoring structural identification and diagnostics is of strategic importance in many branches of civil and mechanical engineering This type of tests is widely practiced and directly affects topical issues regarding the design of new buildings and the repair and monitoring of existing ones The load bearing capacity of a structure can now be evaluated using well established mechanical modelling methods aided by computing facilities of great capability However to ensure reliable results models must be calibrated with accurate information on the characteristics of materials and structural components To this end non destructive techniques are a useful tool from several points of view Particularly by measuring structural response they provide guidance on the validation of structural descriptions or of the mathematical models of material behaviour Diagnostic engineering is a crucial area for the application of non destructive testing methods Repeated tests over time can indicate the emergence of possible damage occurring during the structure's lifetime and provide quantitative estimates of the level of residual safety     **The Dynamics of Vehicles on Roads and Tracks** Martin
