Teaching Science and Investigating Environmental Issues with Geospatial Technology James MaKinster, Nancy Trautmann, Michael Barnett, 2013-11-05 The emerging field of using geospatial technology to teach science and environmental education presents an excellent opportunity to discover the ways in which educators use research grounded pedagogical commitments in combination with their practical experiences to design and implement effective teacher professional development projects Often missing from the literature are in depth explicit discussions of why and how educators choose to provide certain experiences and resources for the teachers with whom they work and the resulting outcomes The first half of this book will enable science and environmental educators to share the nature and structure of large scale professional development projects while discussing the theoretical commitments that undergird their work Many chapters will include temporal aspects that present the ways in which projects change over time in response to evaluative research and practical experience In the second half of the book faculty and others whose focus is on national and international scales will share the ways in which they are working to meet the growing needs of teachers across the globe to incorporate geospatial technology into their science teaching These efforts reflect the ongoing conversations in science education geography and the geospatial industry in ways that embody the opportunities and challenges inherent to this field

This edited book will serve to define the field of teacher professional development for teaching science using geospatial technology. As such, it will identify short-term and long-term objectives for science, environmental, and geography educators involved in these efforts. As a result, this book will provide a framework for future projects and research in this exciting and growing field.

Modeling and Simulation in Science and Mathematics Education Wallace Feurzeig, Nancy Roberts, 2012-12-06 The world consists of many complex systems ranging from our own bodies to ecosystems to economic systems. Despite their diversity, complex systems have many structural and functional features in common that can be effectively simulated using powerful user-friendly software. As a result, virtually anyone can explore the nature of complex systems and their dynamical behavior under a range of assumptions and conditions. This ability to model dynamic systems is already having a powerful influence on teaching and studying complexity. The books in this series will promote this revolution in systems thinking by integrating skills of numeracy and techniques of dynamic modeling into a variety of disciplines. The unifying theme across the series will be the power and simplicity of the model building process, and all books are designed to engage the reader in developing their own models for exploration of the dynamics of systems that are of interest to them. *Modeling Dynamic Systems* does not endorse any particular modeling paradigm or software. Rather, the volumes in the series will emphasize simplicity of learning, expressive power, and the speed of execution as priorities that will facilitate deeper system understanding.
