Virtual Lab – Porosity and Permeability

Purpose: To investigate how different types of soil hold water.

Question: How does soil type affect the movement of groundwater?

Background Information: Groundwater is water that moves through soil and rocks below Earth's surface. When groundwater moves through soil, the structure of the soil affects its movement. Groundwater moves through the spaces between soil particles. These spaces are called pores. Not all soils have the same amount of pore space. **Porosity** depends on the number and size of pores in soil. The pores in soil are all connected, allowing water to pass through them. This means that soil is permeable. The ease with which water moves through the soil is called **permeability**.

Explain porosity and permeability in your own words.

Porosity –

Permeability –

A soil with high porosity and many small pores can hold a lot of water, but it takes longer for the water to enter all the pores. This means that when a soil has higher porosity it has lower permeability. A soil's porosity and permeability are important to many people. Farmers must be aware of these soil conditions so they can determine the best way to grow crops. Builders also consider these conditions in the area they plan to build. Environmentalists are concerned with porosity and permeability when there is a risk that a pollutant might be introduced into the groundwater supply.

Prediction: Based on what you know about soil texture, which type of soil do you think will be most permeable? Explain your reasoning.
