Student Exploration: Archimedes' Principle

Vocabulary: Archimedes' principle, buoyant force, density, displace, mass, volume, weight

Prior Knowledge Questions (Do these BEFORE using the Gizmo.)

1. Why does a small pebble sink in water? Because its density is higher than that of the water.

1. A motorboat is a lot heavier than a pebble. Why does the boat float?

because the boat is less dense than the surrounding water.

Gizmo Warm-up

When you place an object in liquid, the downward pull of gravity causes it to start to sink. As the object sinks, the liquid pushes back up on the object with a force that opposes gravity.

In the *Archimedes' Principle* Gizmo, you will see how these forces cause objects to either sink or float.

- Check that the **Width**, **Length**, and **Height** of the boat are set to 5.0 cm. Drag one of the green 50-g cubes into the rectangular "boat."

What happens? The boat sank slightly and water was displaced.

- Add cubes until the boat sinks. What **mass** of cubes causes the boat to sink? 150g

(Note: In this Gizmo, the mass of the boat itself is insignificant.)

- Click **Reset**. Experiment with different boat dimensions until you create a boat that holds the most cubes without sinking.

A. What are the boat's dimensions? Width: 10g Length: 10g Height: 10g
