Student Exploration: Archimedes' Principle

Directions: Follow the instructions to go through the simulation. Respond to the questions and prompts in the orange boxes.

Vocabulary: Archimedes' principle, buoyant force, density, displace, mass, volume, weight

Prior Knowledge Questions (Do these BEFORE using the Gizmo.)

1. Why does a small pebble sink in water?

Because it weighs more than the water it displaces, a little stone sinks.

2. A motorboat is a lot heavier than a pebble. Why does the boat float?

Because its weight is equivalent to the weight of the water it moves, a motorboat floats.

Gizmo Warm-up

When you place an object in liquid, the downward pull of gravity causes it to start to sink. As the object sinks, the liquid pushes back up on the object with a force that opposes gravity.

In the *Archimedes' Principle* Gizmo, you will see how these forces cause objects to either sink or float.

1. Check that the **Width**, **Length**, and **Height** of the boat are set to 5.0 cm. Drag one of the green **50-g cubes** into the rectangular "boat."

What happens?

The boat submerges 2 centimeters into the water.

2. Add cubes until the boat sinks. What **mass** of cubes causes the boat to sink?

150 g

(Note: In this Gizmo, the mass of the boat itself is insignificant.)

3. Click **Reset**. Experiment with different boat dimensions until you create a boat that holds the most cubes without sinking.

A. What are the boat's dimensions? Width: 10 cm Length: 10 cm Height: 10 cm

B. How much mass can the boat hold without sinking? 950 g or 19 cubes
