Computation and Comparison of Efficient Turbulence Models for Aeronautics — European Research Project ETMA Alain Dervieux, Marianna Braza, Jean-Paul Dussauge, 2013-04-17 The computation of complex turbulent flows by statistical modelling has already a long history The most popular two equation models today were introduced in the early seventies However these models have been generally tested in rather academic cases The development of computers has led to more and more accurate numerical methods The interactions between numerical and modelling techniques are generally not well mastered Moreover computation of real life cases including 3D effects complex geometries and pressure gradients based on two equation models with low Reynolds treatment at the proximity of walls are not really of common use A large number of models has been proposed this is perhaps the sign that none of them is really satisfactory and then the assessment of their generality is not an easy task it requires a lot of understanding of the physics and a lot of work for testing the large number of relevant cases in order to assess their limits of validity which is a condition for an improved confidence in engineering applications This is probably why workshops and working groups are frequent and the ETMA consortium has chosen to build a state of the art in theoretical and numerical statistical turbulence modelling for real life computations by taking some marks with respect to previous workshops such as the Stanford meetings 1980 1981 some problems are kept or updated by new experiments some problems are discarded some new problems are introduced the focus is kept on flows with 2D geometries
