The success of business today is dependent on the knowledge and expertise of its employees. The need for mathematics arises naturally in business such as in the work of the actuary in an insurance company, the financial mathematics required in the day to day work of the banker, and the need to analyse data to extract useful information to enable the business to make the right decisions to be successful. A Guide to Business Mathematics provides a valuable self study guide to business practitioners, business students, and the general reader to enable them to gain an appropriate insight into the mathematics used in business. This book offers an accessible introduction to essential mathematics for the business field. A wide selection of topics is discussed with the mathematical material presented in a reader friendly way. The business context motivates the presentation. The author uses modelling and applications to motivate the material, demonstrating how mathematics is used in the financial sector. In addition to the role of the actuary and the banker, the book covers operations research, including game theory, trade discounts, and the fundamentals of statistics and probability. The book is also a guide to using metrics to manage and measure performance and business economics. Foundations on algebra, number theory, sequences and series, matrix theory, and calculus are included, as is a complete chapter on using software. Features: Discusses simple interest and its application to promissory notes, treasury bills. Discusses compound interest with applications to present and future values. Introduces the banking field, including loans, annuities, and the spot forward FX market. Discusses trade discounts and markups/markdowns. Introduces the insurance field and the role of the actuary. Introduces the fields of data analytics and operations research. Discusses business metrics and problem solving. Introduces matrices and their applications. Discusses calculus and its applications. Discusses basic financial statements such as balance sheet, profit and loss, and cash account. Reviews a selection of software to support business mathematics. This broad ranging text gives the reader a flavour of the applications of mathematics to the business field and stimulates further study in the subject. As such, it will be of great benefit to business students while also capturing the interest of the more casual reader.

Gregoire, David R. Brillinger, Peter Diggle, Estelle Russek-Cohen, William G. Warren, Russell D. Wolfinger, 2012-12-06 Correlated data arise in numerous contexts across a wide spectrum of subject matter disciplines Modeling such data present special challenges and opportunities that have received increasing scrutiny by the statistical community in recent years In October 1996 a group of 210 statisticians and other scientists assembled on the small island of Nantucket U S A to present and discuss new developments relating to Modelling Longitudinal and Spatially Correlated Data Methods Applications and Future Directions Its purpose was to provide a cross disciplinary forum to explore the commonalities and meaningful differences in the source and treatment of such data This volume is a compilation of some of the important invited and volunteered presentations made during that conference The three days and evenings of oral and displayed presentations were arranged into six broad thematic areas The session themes the invited speakers and the topics they addressed were as follows Generalized Linear Models Peter McCullagh Residual Likelihood in Linear and Generalized Linear Models Longitudinal Data Analysis Nan Laird Using the General Linear Mixed Model to Analyze Unbalanced Repeated Measures and Longitudinal Data Spatio Temporal Processes David R Brillinger Statistical Analysis of the Tracks of Moving Particles Spatial Data Analysis Noel A Cressie Statistical Models for Lattice Data Modelling Messy Data Raymond J Carroll Some Results on Generalized Linear Mixed Models with Measurement Error in Covariates Future Directions Peter J Learn from the Masters Frank Swetz, John Fauvel, Otto Bekken, Bengt Johansson, Victor Katz, 1995-12-31 This book is for high school and college teachers who want to know how they can use the history of mathematics as a pedagogical tool to help their students construct their own knowledge of mathematics Often a historical development of a particular topic is the best way to present a mathematical topic but teachers may not have the time to do the research needed to present the material This book provides its readers with historical ideas and insights which can be immediately applied in the classroom The book is divided into two sections the first on the use of history in high school mathematics and the second on its use in university mathematics The articles are diverse covering fields such as trigonometry mathematical modeling calculus linear algebra vector analysis and celestial mechanics Also included are articles of a somewhat philosophical nature which give general ideas on why history should be

used in teaching and how it can be used in various special kinds of courses Each article contains a bibliography to guide the reader to further reading on the subject **Data-Driven Modeling & Scientific Computation** J. Nathan Kutz, 2013-08-08

The burgeoning field of data analysis is expanding at an incredible pace due to the proliferation of data collection in almost every area of science The enormous data sets now routinely encountered in the sciences provide an incentive to develop mathematical techniques and computational algorithms that help synthesize interpret and give meaning to the data in the context of its scientific setting A specific aim of this book is to integrate standard scientific computing methods with data analysis By doing so it brings together in a self consistent fashion the key ideas from statistics time frequency analysis and low dimensional reductions The blend of these ideas provides meaningful insight into the data sets one is faced with in every scientific subject today including those generated from complex dynamical systems This is a particularly exciting field and much of the final part of the book is driven by intuitive examples from it showing how the three areas can be used in combination to give critical insight into the fundamental workings of various problems Data Driven Modeling and Scientific Computation is a survey of practical numerical solution techniques for ordinary and partial differential equations as well as algorithms for data manipulation and analysis Emphasis is on the implementation of numerical schemes to practical problems in the engineering biological and physical sciences An accessible introductory to advanced text this book fully integrates MATLAB and its versatile and high level programming functionality while bringing together computational and data skills for both undergraduate and graduate students in scientific computing
