endothelium dendritic cells and T cells generating a self sustaining inflammatory cycle Within this cycle epidermal CD8 T lymphocytes specific for self antigens may represent the major autoimmune mechanism Despite the recent progress in the comprehension of the pathogenesis of psoriasis many questions remain open ranging from the plaque initiating events to the characterization of the autoimmune autoinflammatory components of the disease The mechanisms that link cutaneous psoriasis to its extra cutaneous and systemic manifestations also remain vague In this Research Topic we invited top scientists to summarize the front line research in the field of immunology of cutaneous psoriasis and its systemic and joint manifestations Our intention was to integrate the pillar concepts of psoriasis immunopathology with the most novel insights aiming at providing an advanced view of this rapidly evolving and fascinating field **AdrenalineMoto | Street**

Barth,D.E. Carpenter,A.H. Soloway,2012-12-06

Binary systems for the treatment of cancer potentially are among the most attractive of the new therapeutic modalities that

currently are under investigation The basic concept is to selectively destroy malignant cells while concomitantly sparing normal tissue Neutron capture therapy NCT is the binary system that has been the subject of the Fifth International Symposium on Neutron Capture Therapy which was held September 13-17 1992 in Columbus Ohio under the auspices of the International Society for Neutron Capture Therapy Its objective was to bring together researchers from throughout the world and to provide a forum at which they could present the latest advances in the development of Neutron capture therapy Neutron capture therapy has largely but not exclusively focused on the use of boron 10 as the target nuclide Boron neutron capture therapy BNCT is based on the nuclear reaction that occurs when the stable isotope boron 10 absorbs low energy non ionizing thermal neutrons to yield alpha particles and recoiling lithium 7 nuclei The size and energy of these high linear energy transfer LET particles result in their being confined largely to the cells in which the capture reaction occurs For BNCT to be successful a sufficient number of B atoms must be localized within neoplastic cells and enough thermal neutrons must be delivered and absorbed by the B to produce a lethal $10\text{B}(n,\alpha)^7\text{Li}$ reaction Two major problems must be surmounted
