**Integrated Circuit and System Design. Power and Timing Modeling, Optimization and Simulation** Jorge Juan Chico, Enrico Macii, 2003-10-02 Welcome to the proceedings of PATMOS 2003 This was the 13th in a series of international workshops held in several locations in Europe Over the years PATMOS has gained recognition as one of the major European events devoted to power and timing aspects of integrated circuit and system design Despite its significant growth and development PATMOS can still be considered as a very informal forum featuring high level scientific presentations together with open discussions and panel sessions in a free and relaxed environment This year PATMOS took place in Turin Italy organized by the Politecnico di Torino with technical co sponsorship from the IEEE Circuits and Systems Society and the generous support of the European Commission as well as that of several industrial sponsors including BullDAST Cadence Mentor Graphics STMicroelectronics and Synopsys The objective of the PATMOS workshop is to provide a forum to discuss and investigate the emerging problems in methodologies and tools for the design of new generations of integrated circuits and systems A major emphasis of the technical program is on speed and low power aspects with particular regard to modeling characterization design and architectures

**Ultra-Low Energy Domain-Specific Instruction-Set Processors** Francky Catthoor, Praveen Raghavan, Andy Lambrechts, Murali Jayapala, Angeliki Kritikakou, Javed Absar, 2010-08-05 Modern consumers carry many electronic devices like a mobile phone digital camera GPS PDA and an MP3 player The functionality of each of these devices has gone through an important evolution over recent years with a steep increase in both the number of features as in the quality of the services that they provide However providing the required compute power to support an uncompromised combination of all this functionality is highly non trivial Designing processors that meet the demanding requirements of future mobile devices requires the optimization of the embedded system in general and of the embedded processors in particular as they should strike the correct balance between flexibility energy efficiency and performance In general a

designer will try to minimize the energy consumption as far as needed for a given performance with a sufficient flexibility. However, achieving this goal is already complex when looking at the processor in isolation but in reality the processor is a single component in a more complex system. In order to design such complex system successfully, critical decisions during the design of each individual component should take into account effect on the other parts with a clear goal to move to a global Pareto optimum in the complete multi-dimensional exploration space. In the complex global design of battery-operated embedded systems, the focus of Ultra Low Energy Domain Specific Instruction Set Processors is on the energy-aware architecture exploration of domain-specific instruction set processors and the co-optimization of the datapath architecture, foreground memory and instruction memory organisation with a link to the required mapping techniques or compiler steps at the early stages of the design. By performing an extensive energy breakdown experiment for a complete embedded platform, both energy and performance bottlenecks have been identified together with the important relations between the different components. Based on this knowledge, architecture extensions are proposed for all the bottlenecks.

*The Promise of Assistive Technology to Enhance Activity and Work Participation* National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Board on Health Care Services, Committee on the Use of Selected Assistive Products and Technologies in Eliminating or Reducing the Effects of Impairments, 2017-09-01. The U.S. Census Bureau has reported that 56.7 million Americans had some type of disability in 2010, which represents 18.7 percent of the civilian noninstitutionalized population included in the 2010 Survey of Income and Program Participation. The U.S. Social Security Administration (SSA) provides disability benefits through the Social Security Disability Insurance (SSDI) program and the Supplemental Security Income (SSI) program. As of December 2015, approximately 11 million individuals were SSDI beneficiaries and about 8 million were SSI beneficiaries. SSA currently considers assistive devices in the nonmedical and medical areas of its program guidelines. During determinations of substantial gainful activity and income eligibility for SSI benefits, the reasonable cost of items, devices, or services applicants need to enable them to work with their impairment is subtracted from eligible earnings, even if those items or services are used for activities of daily living in addition to work. In addition, SSA considers assistive devices in its medical disability determination process and assessment of work capacity. *The Promise of Assistive Technology to Enhance Activity and Work Participation* provides an analysis of selected assistive products and technologies, including wheeled and seated mobility devices, upper extremity prostheses, and products and technologies selected by the committee that pertain to hearing and to communication and speech in adults.

*Next Generation Spin Torque Memories* Brajesh Kumar Kaushik, Shivam Verma, Anant Aravind Kulkarni, Sanjay Prajapati, 2017-04-07. This book offers detailed insights into spin transfer torque (STT) based devices, circuits, and memories. Starting with the basic concepts and device physics, it then addresses advanced STT applications and discusses the outlook for this cutting-edge technology. It also describes the architecture, performance parameters, fabrication, and the prospects of

STT based devices Further moving from the device to the system perspective it presents a non volatile computing architecture composed of STT based magneto resistive and all spin logic devices and demonstrates that efficient STT based magneto resistive and all spin logic devices can turn the dream of instant on off non volatile computing into reality
