Compagno, 1988 This book is a general review taxonomic revision and phylogenetic analysis of the carcharhinoids the largest group of living sharks which comprises almost 60 percent or 200 of known shark species Students of shark biology have been hampered by the lack of just such a comprehensive and rigorous account of shark morphology With this work L J V Compagno offers not only the most comprehensive and detailed account of this important but neglected group to date but also one of the most comprehensive modern anatomical and phylogenetic studies on cartilaginous fishes available It will become an essential reference not only for researchers on carcharhinoids but also for those who study other families of

sharks and for paleontologists interested in this ancient group of fishes The book begins with a general account of carcharhinoid sharks Chapters Two through Eleven include detailed discussions of character systems used in taxonomic and phylogenetic analysis of carcharhinoids Chapter Twelve defines the Order Carcharhiniformes lists its families and includes a taxonomic key to the families Chapters Thirteen through Twenty review the eight carcharhinoid families and Chapter Twenty One is an extended discussion of the phylogeny of carcharhinoids with cladistic analysis of taxa at various levels

Comparative Analysis of Organochlorine Accumulation in Two Top Predator Shark Species with Contrasting Life History Traits Marina C. Beaudry, Understanding Population Connectivity in Shortfin Mako Shark (*Isurus Oxyrinchus*) at Multiple Spatial Scales, 2015 Pelagic sharks are both ecologically and economically valuable as top predators and fishery targets respectively Their highly migratory nature and cryptic life histories make them logistically difficult to study Despite their frequent interaction with various global fisheries they are difficult to effectively manage Understanding population connectivity across their cosmopolitan distributions makes international management more likely Population genetics is a powerful tool to address questions of functional population connectivity Allele frequencies can identify interbreeding population segments but cannot directly identify individual movement Tagging on the other hand monitors the movement of individuals but is limited in inference by the number of tags applied Together using both molecular tools and tag analyses can provide valuable insight into the ecology of traditionally data poor species Two of the shark species most impacted by international fisheries are the shortfin mako *Isurus oxyrinchus* and the common thresher *Alopias vulpinus* In the first chapter of this dissertation I developed and optimized nuclear microsatellite loci for both mako and thresher sharks I then used these loci to test for polyandry in a litter of thresher pups I developed and optimized 11 novel microsatellite loci for use on shortfin mako shark I also developed and optimized six novel microsatellite loci and successfully cross screened two mako loci for use on common thresher shark The analysis of a single litter of thresher pups indicates that polyandry is likely in this pelagic shark The second chapter focuses on understanding mako population connectivity for makos across the US Mexico border in the Southern California Bight To address this question I use the newly described microsatellite loci and both conventional and archival tag data Microsatellite analysis across the US Mexico border indicates that makos in the region comprise a single genetic unit and both conventional and SPOT tag results corroborate that finding Temporal effective population size analysis indicates that the Southern California Bight supports a robust and diverse population of mako sharks My third chapter looks at mako population connectivity across the entire Pacific Ocean using a combination of nuclear and mitochondrial loci supported by tag analyses On a larger spatial scale shortfin mako exhibit barriers to mitochondrial gene flow across the equator and east to west across the south Pacific Nuclear microsatellites on the other hand do not show evidence of spatial structuring with the Pacific Ocean basin This indicates that makos exhibit gender mediated dispersal on oceanic scales This pattern is weakly supported by tag recapture analysis
