*Synthesizable VHDL Design for FPGAs* Eduardo Augusto Bezerra, Djones Vinicius Lettnin, 2013-10-21

The methodology described in this book is the result of many years of research experience in the field of synthesizable VHDL design targeting FPGA based platforms VHDL was first conceived as a documentation language for ASIC designs Afterwards the language was used for the behavioral simulation of ASICs and also as a design input for synthesis tools VHDL is a rich language but just a small subset of it can be used to write synthesizable code from which a physical circuit can be obtained Usually VHDL books describe both synthesis and simulation aspects of the language but in this book the reader is conducted just through the features acceptable by synthesis tools The book introduces the subjects in a gradual and concise way providing just enough information for the reader to develop their synthesizable digital systems in VHDL The examples in the book were planned targeting an FPGA platform widely used around the world

From scientific instrument to industrial machine Richard Doornbos, Sjur van Loo, 2012-04-28

Architectural stress is the inability of a system design to respond to new market demands It is an important yet often concealed issue in high tech systems In From scientific instrument to industrial machine we look at the phenomenon of architectural stress in embedded systems in the context of a transmission electron microscope system built by FEI Company Traditionally transmission electron microscopes are manually operated scientific instruments but they also have enormous potential for use in industrial applications However this new market has quite different characteristics There are strong demands for cost effective analysis accurate and precise measurements and ease of use These demands can be translated into new system qualities e g reliability predictability and high throughput as well as new functions e g automation of electron microscopic analyses automated focusing and positioning functions From scientific instrument to industrial machine takes a pragmatic approach to the problem of architectural stress In particular it describes the outcomes of the Condor project a joint endeavour by a consortium of industrial and academic partners In this collaboration an integrated approach was essential to successfully

combine various scientific results and show the first steps towards a new direction System modelling and prototyping were the key techniques to develop better understanding and innovative solutions to the problems associated with architectural stress From scientific instruments to industrial machine is targeted mainly at industrial practitioners in particular system architects and engineers working on high tech systems It can therefore be read without particular knowledge of electron microscope systems or microscopic applications The book forms a bridge between academic and applied science and high tech industrial practice By showing the approaches and solutions developed for the electron microscope it is hoped that system designers will gain some insights in how to deal with architectural stress in similar challenges in the high tech industry

**Digital Systems** Ronald J. Tocci,1998-01      **Modeling Time in Computing** Carlo A. Furia,Dino Mandrioli,Angelo Morzenti,Matteo Rossi,2012-10-19 Models that include a notion of time are ubiquitous in disciplines such as the natural sciences engineering philosophy and linguistics but in computing the abstractions provided by the traditional models are problematic and the discipline has spawned many novel models This book is a systematic thorough presentation of the results of several decades of research on developing analyzing and applying time models to computing and engineering After an opening motivation introducing the topics structure and goals the authors introduce the notions of formalism and model in general terms along with some of their fundamental classification criteria In doing so they present the fundamentals of propositional and predicate logic and essential issues that arise when modeling time across all types of system Part I is a summary of the models that are traditional in engineering and the natural sciences including fundamental computer science dynamical systems and control theory hardware design and software algorithmic and complexity analysis Part II covers advanced and specialized formalisms dealing with time modeling in heterogeneous software intensive systems formalisms that share finite state machines as common ancestors Petri nets in many variants notations based on mathematical logic such as temporal logic process algebras and dual language approaches combining two notations with different characteristics to model and verify complex systems e g model checking frameworks Finally the book concludes with summarizing remarks and hints towards future developments and open challenges The presentation uses a rigorous yet not overly technical style appropriate for readers with heterogeneous backgrounds and each chapter is supplemented with detailed bibliographic remarks and carefully chosen exercises of varying difficulty and scope The book is aimed at graduate students and researchers in computer science while researchers and practitioners in other scientific and engineering disciplines interested in time modeling with a computational flavor will also find the book of value and the comparative and conceptual approach makes this a valuable introduction for non experts The authors assume a basic knowledge of calculus probability theory algorithms and programming while a more advanced knowledge of automata formal languages and mathematical logic is useful
