

Using Clues to Identify Elements

Background Information

Chemical elements can be classified according to their properties as metals, nonmetals, and metalloids. Metals are good conductors of heat and electricity. Many metals are malleable and ductile. Nonmetals are poor conductors of heat and electricity, and solid nonmetals tend to be brittle. Metalloids have properties between those of metals and nonmetals.

Elements in the same group on the periodic table have the same number of valence electrons, which are electrons in the highest occupied energy level of an atom. The number of an A group matches the number of valence electrons in atoms of each element in the group. For example, the Group 4A elements each have four valence electrons per atom. The exception to this pattern is the element helium, which is in Group 8A but has only two valence electrons.

Because elements in a group have the same number of valence electrons, they tend to have similar properties. The most reactive metals are the **alkali metals** in Group 1A on the far left side of the periodic table. The Group 2A elements are the **alkaline earth metals**, which are somewhat less reactive than the alkali metals. Groups of elements become less metallic in their properties from left to right across the periodic table. The most reactive nonmetals are the **halogens** in Group 7A. Group 8A contains the **noble gases**, which are colorless and odorless, and rarely react with other elements.

In this investigation, you will use a list of clues to identify 24 elements and place them in their correct locations in the periodic table.

Civilization and the Culture of Science Stephen Gaukroger, 2020-02-19 How did science come to have such a central place in Western culture How did cognitive values and subsequently moral political and social ones come to be modelled around scientific values In Civilization and the Culture of Science Stephen Gaukroger explores how these values were shaped and how they began in turn to shape those of society The core nineteenth and twentieth century development is that in which science comes to take centre stage in determining ideas of civilization displacing Christianity in this role Christianity had provided a unifying thread in the study of the world however and science had to match this which it did through the project of the unity of the sciences The standing of science came to rest or fall on this question which the book sets out to show in detail is essentially ideological not something that arose from developments within the sciences which remained pluralistic and modular A crucial ingredient in this process was a fundamental rethinking of the relations between science and ethics economics philosophy and engineering In his engaging description of this transition to a scientific modernity Gaukroger examines five of the issues which underpinned this shift in detail changes in the understanding of civilization the push to
