Development and Novel Applications of Geochemical Proxies in Marine and Terrestrial Carbonate Records Johan Schijf, Tsuyoshi Watanabe, Ed Hathorne, Hali Kilbourne, 2024-12-04 Information on parameters like global ice volume or nutrient availability is critical for developing and testing models of climate and environmental conditions in the past few thousand years However reliable measurements of such parameters only go back about a century and before the advent of satellites were sparsely distributed across the planet Instrumental records can be extended through the use of geochemical proxies in well dated carbonate deposits for example Sr Ca ratios in coral aragonite cores as a proxy for sea surface temperature Due to ongoing advances in analytical and micro sampling techniques these proxies now comprise a multitude of elemental ratios isotopic systems and redox couples incorporated in carbonate minerals precipitated by numerous organisms and processes Novel geochemical proxies in carbonate mineral records are being developed by scientists from an increasingly broad spectrum of fields and applied to an ever growing number of environmental systems and questions using a wide variety of advanced analytical instruments and methods Concurrently these developments are leading to new insights that enable established proxies to be reevaluated and improved The time is right for a Research Topic that brings these experts together and helps them push their efforts forward by comparing notes reviewing the present state of the science and highlighting outstanding problems or controversies

White, 2014-03-31 This volume is an integrated overview and synthesis of available data relating to the Quaternary evolution of the River Trent It provides detailed descriptions of the Pleistocene sedimentary records from the Trent its tributaries and related drainage systems a sedimentary record that spans a period of approximately half a million years and the biostratigraphical and archaeological material preserved therein Significant new data are presented from recently discovered sites of geological and archaeological importance including previously unrecognised fluvial deposits as well as novel analyses such as mathematical modelling of fluvial incision as recorded by the river terrace deposits In combination with a thorough review of the literature on the Trent these new data have contributed to revised chronostratigraphical and palaeogeographical frameworks for central England and revealed the complexity of the Pleistocene fluvial and glacial records in this region The fragmentary Trent terrace sequence is an important element of wider reconstructions of Pleistocene palaeodrainage in Britain providing a link between the records preserved in the English Midlands and those in East Anglia
